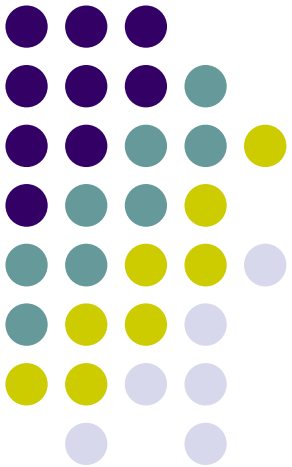
# Computer Graphics (CS 543) Lecture 9 (Part 1): Environment Mapping (Reflections and Refractions)

Prof Emmanuel Agu

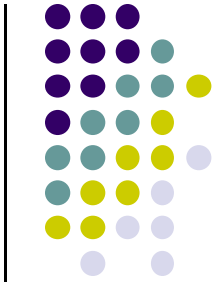
(Adapted from slides by Ed Angel)

*Computer Science Dept.*

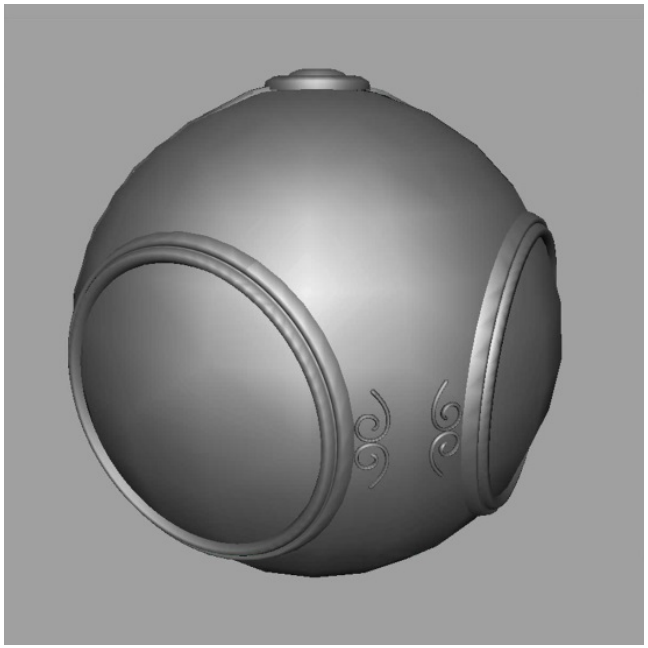
*Worcester Polytechnic Institute (WPI)*

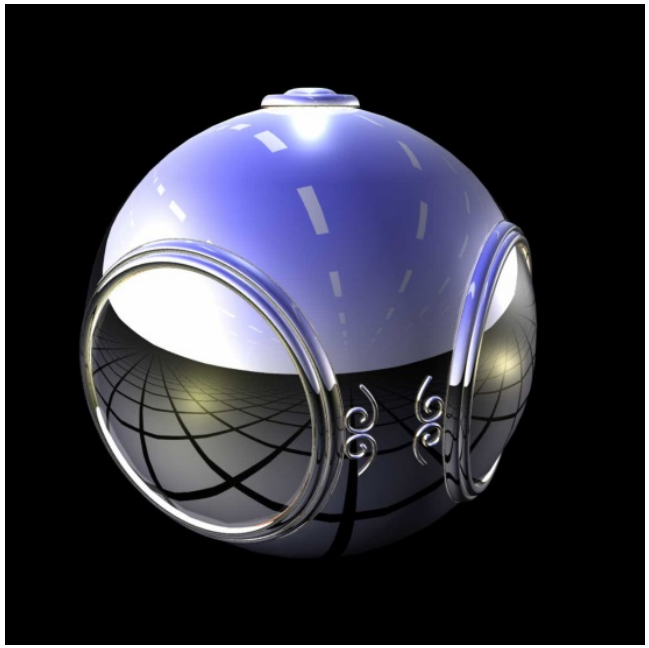


# Environment Mapping

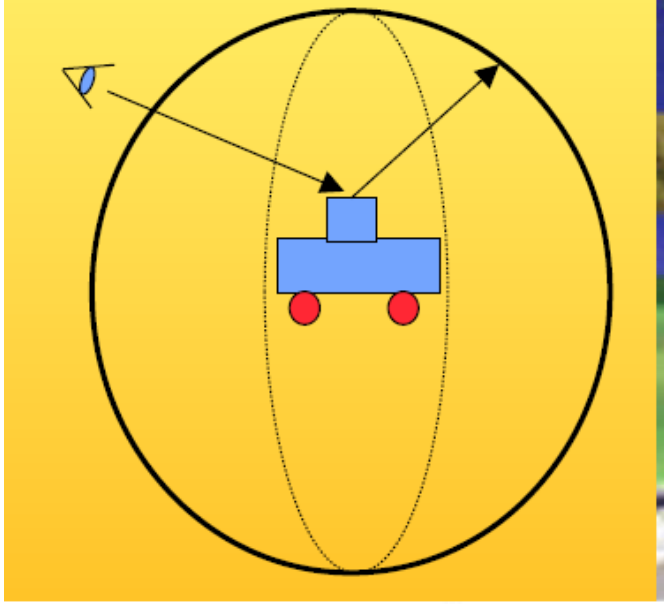


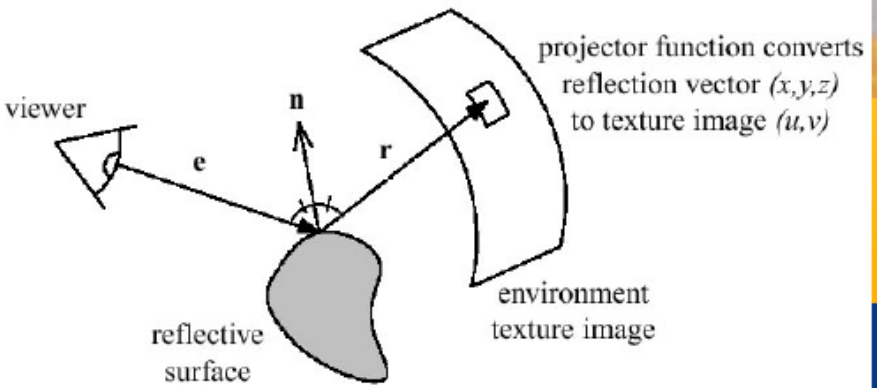
- Used to create appearance of **reflective** and **refractive** surfaces without ray tracing which requires global calculations



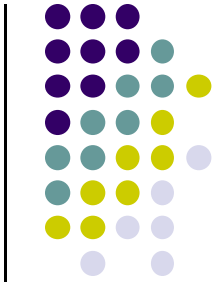


# Environment mapping



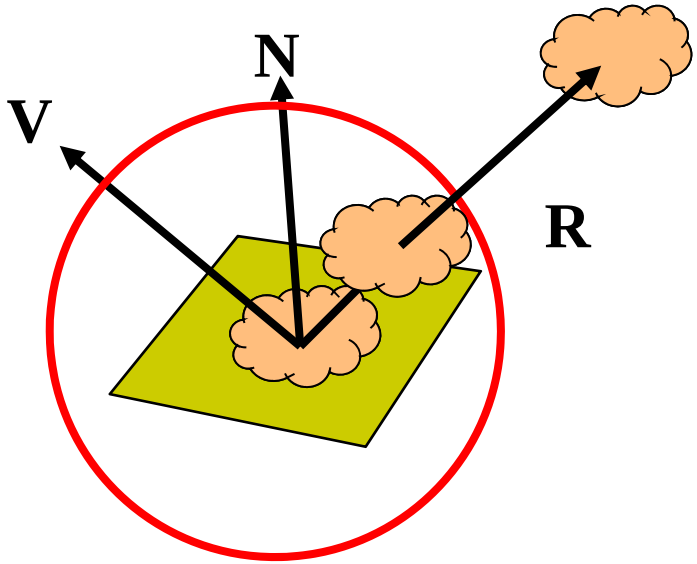


# Types of Environment Maps

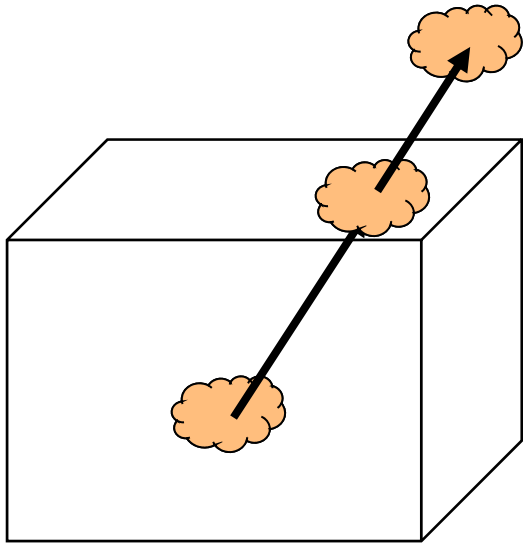


- Assumes environment infinitely far away
- Options: Store “object’s environment as

a) Sphere around object (sphere map)



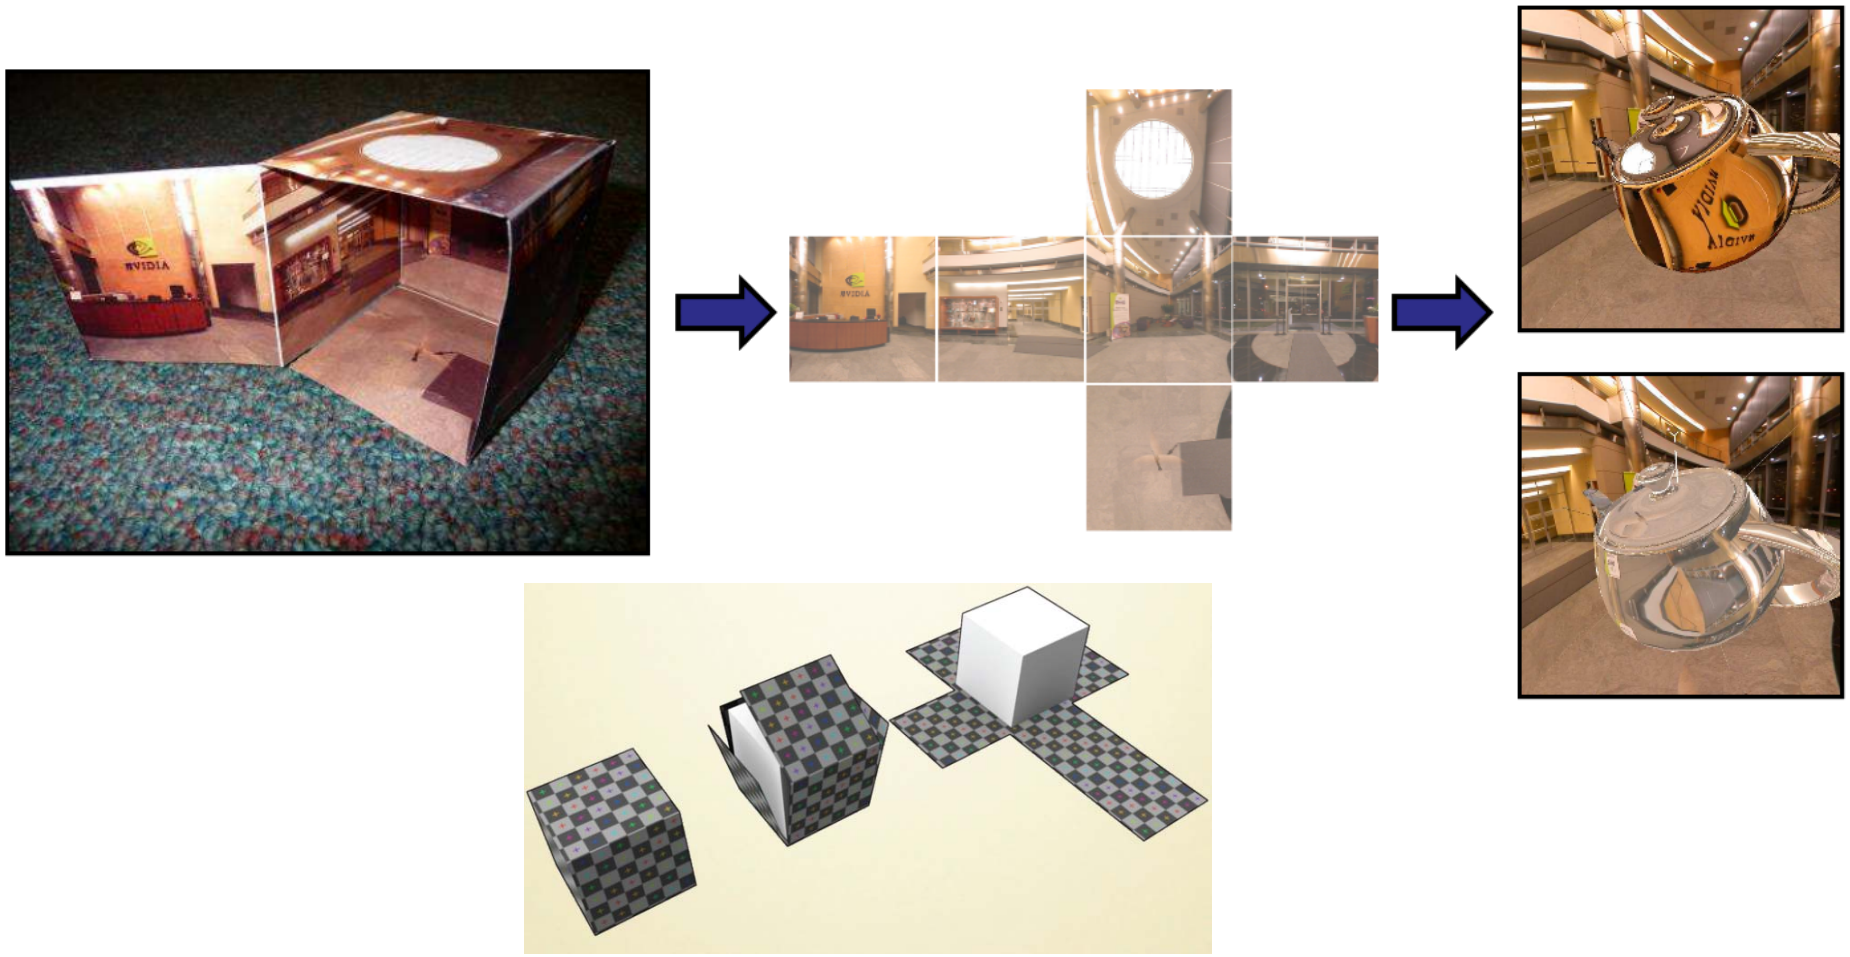
b) Cube around object (cube map)



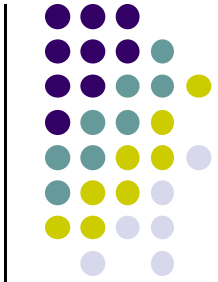
- OpenGL supports **cube maps** and **sphere maps**

# Cube Map

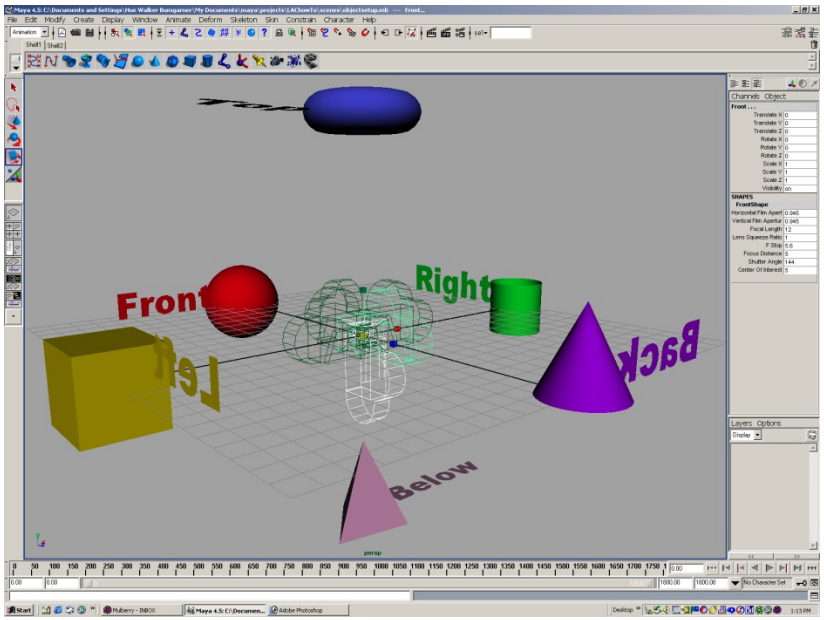
- Stores "**environment**" around objects as 6 sides of a cube (1 texture)

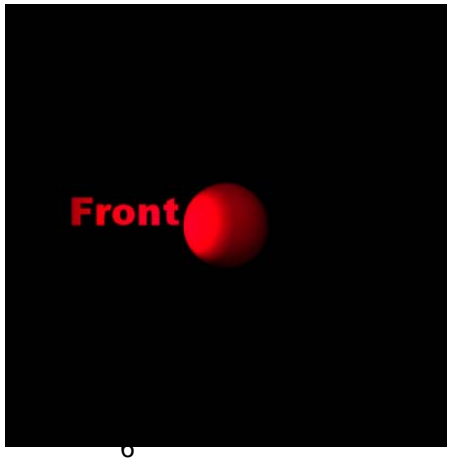


# Forming Cube Map

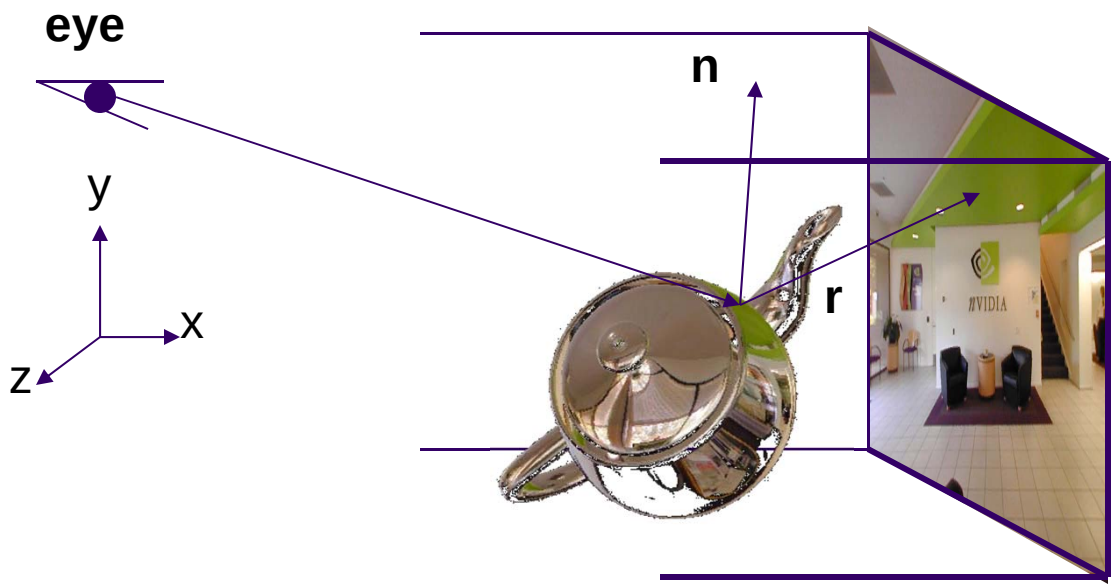


- Use 6 cameras directions from scene center
  - each with a 90 degree angle of view



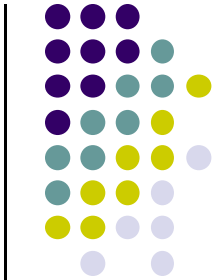


# Reflection Mapping

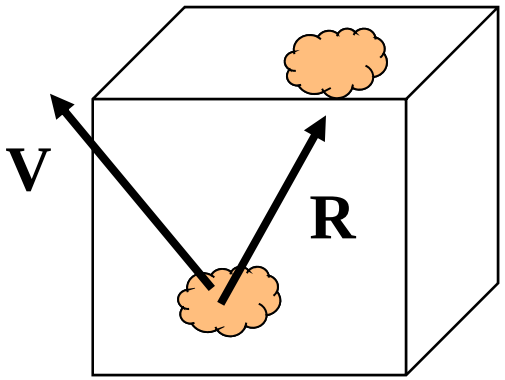


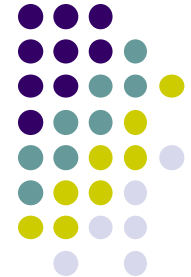
- Need to compute reflection vector, **r**
- Use **r** by for lookup
- OpenGL hardware supports cube maps, makes lookup easier

# Indexing into Cube Map

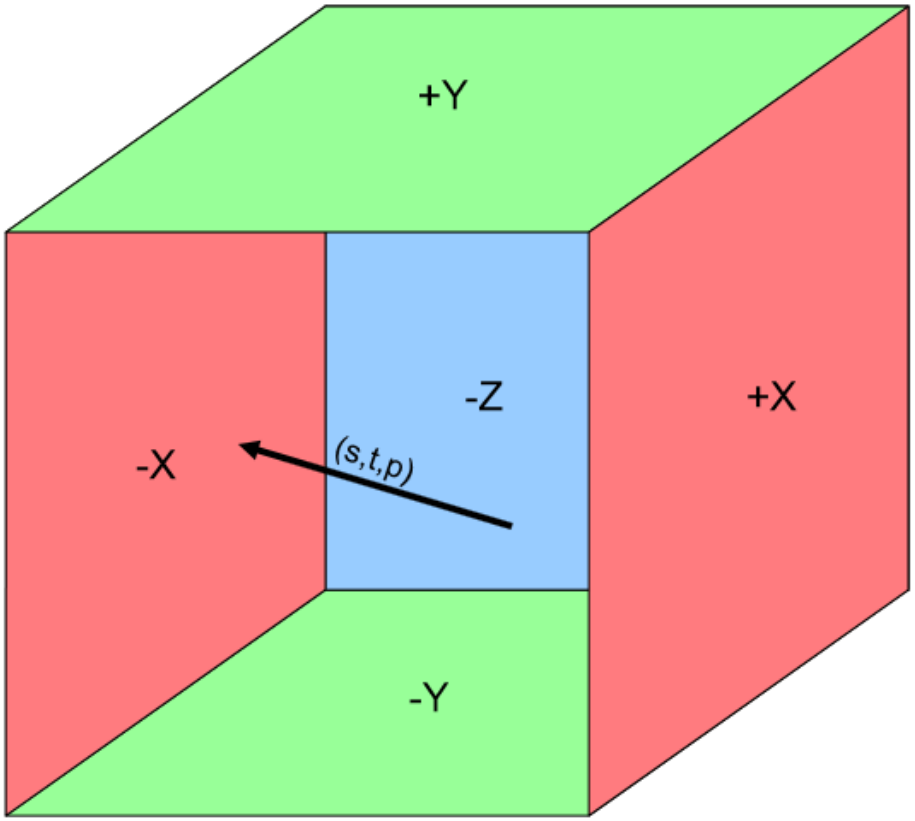


- Compute **R** = 2(**N**·**V**)**N**-**V**
- Object at origin
- Use **largest magnitude component** of R to determine face of cube
- Other 2 components give texture coordinates





## Cube Map Texture Lookup:
## Given an (s,t,p) direction vector , what (r,g,b) does that correspond to?



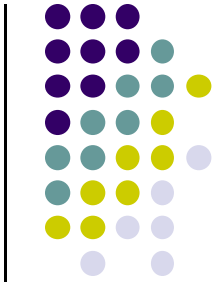
- Let L be the texture coordinate of (s, t, and p) with the largest magnitude
- L determines which of the 6 2D texture "walls" is being hit by the vector (-X in this case)
- The texture coordinates in that texture are the remaining two texture coordinates divided by L: (a/L,b/L)

Built-in GLSL functions

```
vec3 ReflectVector = reflect( vec3 eyeDir, vec3 normal );

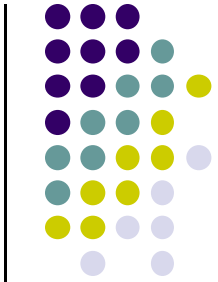
vec3 RefractVector = refract( vec3 eyeDir, vec3 normal, float Eta );
```

# Example



- **R** = (-4, 3, -1)
- Same as **R** = (-1, 0.75, -0.25)
- Use face x = -1 and  y = 0.75, z = -0.25
- Not quite right since cube defined by x, y, z = ± 1 rather than [0, 1] range needed for texture coordinates
- Remap by s = ½ + ½ y, t = ½ + ½ z
- Hence, s =0.875, t = 0.375

# Declaring Cube Maps in OpenGL



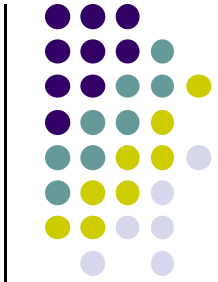
```
glTextureMap2D(GL_TEXTURE_CUBE_MAP_POSITIVE_X, level, rows,
                columns, border, GL_RGBA, GL_UNSIGNED_BYTE, image1)
```

- Repeat similar for other 5 images (sides)
- Make 1 texture object from 6 images
- Parameters apply to all six images. E.g

```
glTexParameteri( GL_TEXTURE_CUBE_MAP,
                 GL_TEXTURE_MAP_WRAP_S,  GL_REPEAT)
```

- **Note:** texture coordinates are in 3D space (s, t, r)

# Cube Map Example (init)



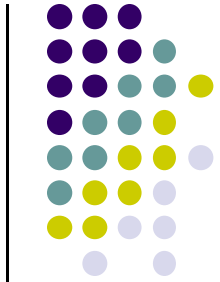
```
// colors for sides of cube
   GLubyte red[3] = {255, 0, 0};
   GLubyte green[3] = {0, 255, 0};
   GLubyte blue[3] = {0, 0, 255};
   GLubyte cyan[3] = {0, 255, 255};
   GLubyte magenta[3] = {255, 0, 255};
   GLubyte yellow[3] = {255, 255, 0};

   glEnable(GL_TEXTURE_CUBE_MAP);

// Create texture object
   glGenTextures(1, tex);
   glActiveTexture(GL_TEXTURE1);
   glBindTexture(GL_TEXTURE_CUBE_MAP, tex[0]);
```

**You can also just load 6 pictures of environment**

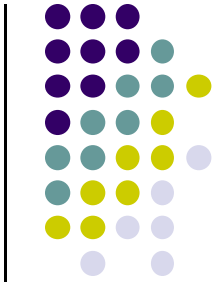
# Cube Map (init II)



You can also just use
6 pictures of environment

```
glTexImage2D(GL_TEXTURE_CUBE_MAP_POSITIVE_X ,
                    0,3,1,1,0,GL_RGB,GL_UNSIGNED_BYTE, red);
glTexImage2D(GL_TEXTURE_CUBE_MAP_NEGATIVE_X ,
                    0,3,1,1,0,GL_RGB,GL_UNSIGNED_BYTE, green);
glTexImage2D(GL_TEXTURE_CUBE_MAP_POSITIVE_Y ,
                    0,3,1,1,0,GL_RGB,GL_UNSIGNED_BYTE, blue);
glTexImage2D(GL_TEXTURE_CUBE_MAP_NEGATIVE_Y ,
                    0,3,1,1,0,GL_RGB,GL_UNSIGNED_BYTE, cyan);
glTexImage2D(GL_TEXTURE_CUBE_MAP_POSITIVE_Z ,
                   0,3,1,1,0,GL_RGB,GL_UNSIGNED_BYTE, magenta);
glTexImage2D(GL_TEXTURE_CUBE_MAP_NEGATIVE_Z ,
                    0,3,1,1,0,GL_RGB,GL_UNSIGNED_BYTE, yellow);
glTexParameteri(GL_TEXTURE_CUBE_MAP,
                        GL_TEXTURE_MAG_FILTER,GL_NEAREST);
```

# Cube Map (init III)

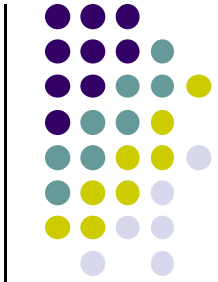


```
GLuint texMapLocation;
GLuint tex[1];

texMapLocation = glGetUniformLocation(program, "texMap");
glUniform1i(texMapLocation, tex[0]);
```

Connect texture map (tex[0])
to variable texMap in fragment shader
(texture mapping done in frag shader)

# Adding Normals



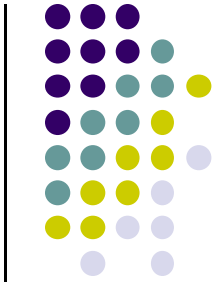
```
void quad(int a, int b, int c, int d)
{
    static int i =0;

    normal = normalize(cross(vertices[b] - vertices[a],
      vertices[c]  - vertices[b]));

    normals[i] = normal;
    points[i] = vertices[a];
    i++;

// rest of data
```

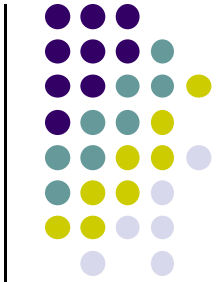
# Vertex Shader



```
out vec3 R;
in vec4 vPosition;
in vec4 Normal;
uniform mat4 ModelView;
uniform mat4 Projection;

void main() {
    gl_Position = Projection*ModelView*vPosition;
    vec4 eyePos  = vPosition;                // calculate view vector V
    vec4 NN = ModelView*Normal;      // transform normal
    vec3 N =normalize(NN.xyz);          // normalize normal
    R = reflect(eyePos.xyz, N);           // calculate reflection vector R
}
```

# Fragment Shader

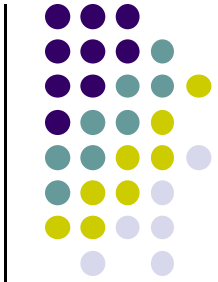


```
in vec3 R;
uniform samplerCube texMap;

void main()
{
    vec4 texColor = textureCube(texMap, R);   // look up texture map using R

   gl_FragColor = texColor;
}
```

# Refraction using Cube Map



- Can also use cube map for refraction (transparent)

Reflection

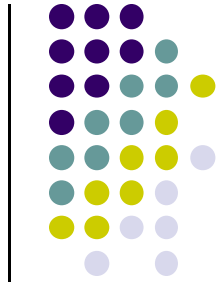
Refraction

# Reflection vs Refraction

Reflection

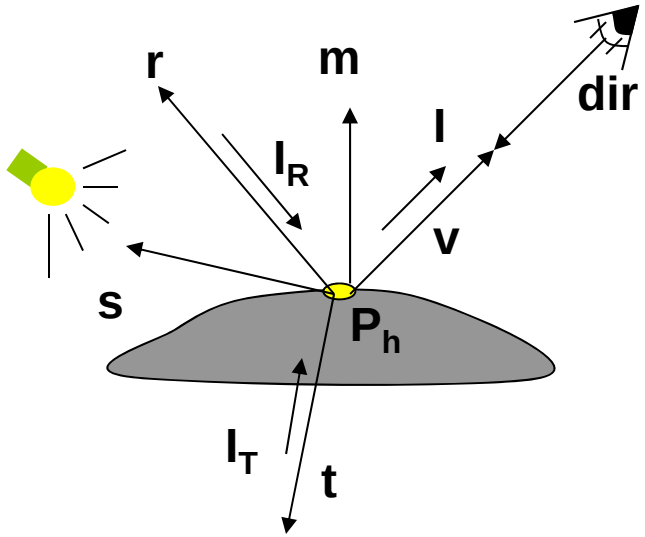
Refraction

# Reflection and Refraction



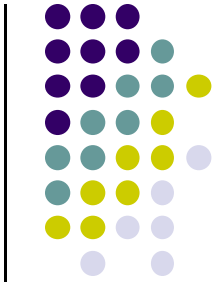
- At each vertex

$$I = I_{amb} + I_{diff} + I_{spec} + I_{refl} + I_{tran}$$

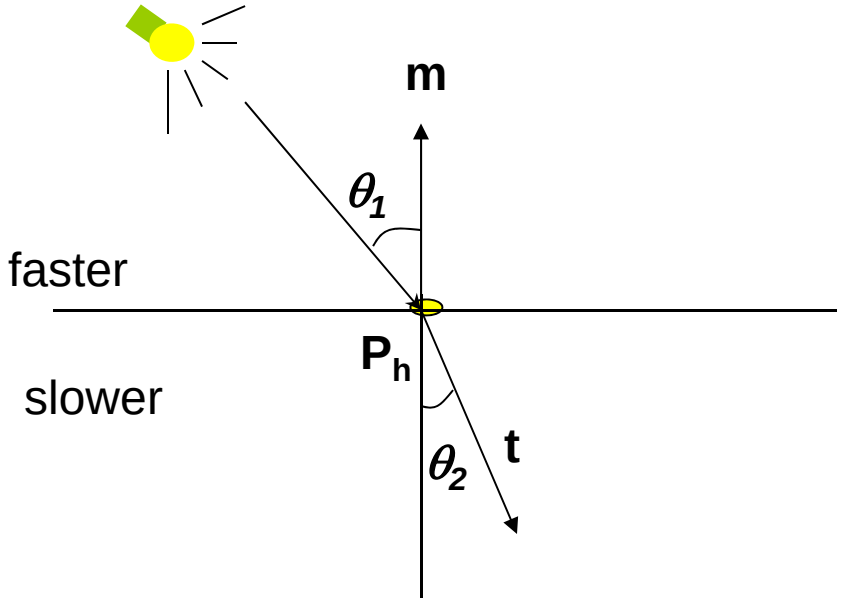


- Refracted component $I_T$ is along transmitted direction **t**

# Finding Transmitted (Refracted) Direction



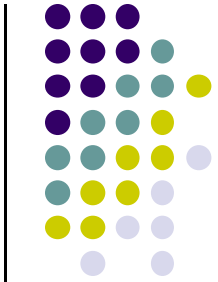
- Transmitted direction obeys **Snell's law**
- Snell's law: relationship holds in diagram below



$$\frac{\sin(\theta_2)}{c_2} = \frac{\sin(\theta_1)}{c_1}$$

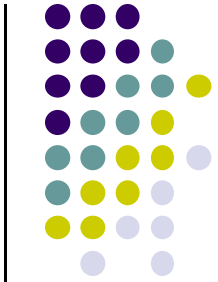
$c_1$, $c_2$ are speeds of light in medium 1 and 2

# Finding Transmitted Direction



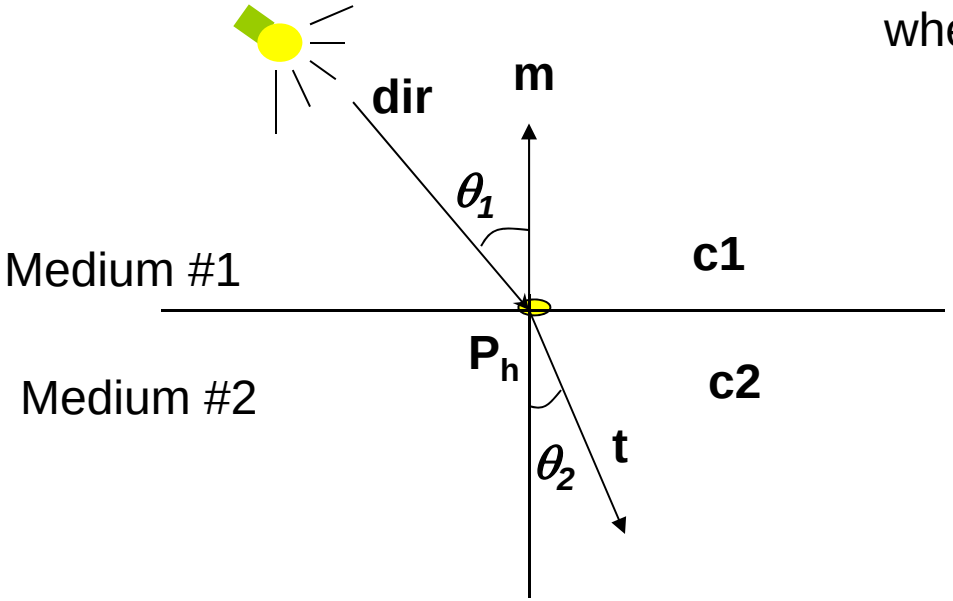
- If ray goes from faster to slower medium, ray is bent **towards** normal
- If ray goes from slower to faster medium, ray is bent **away** from normal
- c1/c2 is important. Usually measured for medium-to-vacuum. E.g water to vacuum
- Some measured relative c1/c2 are:
  - Air: 99.97%
  - Glass: 52.2% to 59%
  - Water: 75.19%
  - Sapphire: 56.50%
  - Diamond: 41.33%

# Transmission Angle



- Vector for transmission angle can be found as

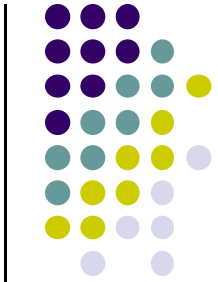
$$\mathbf{t} = \frac{c_2}{c_1}\mathbf{dir} + \left(\frac{c_2}{c_1}(\mathbf{m} \bullet \mathbf{dir}) - \cos(\theta_2)\right)\mathbf{m}$$



where

$$\cos(\theta_2) = \sqrt{1 - \left(\frac{c_2}{c_1}\right)\left(1 - (\mathbf{m} \bullet \mathbf{dir})^2\right)}$$

# Refraction Vertex Shader

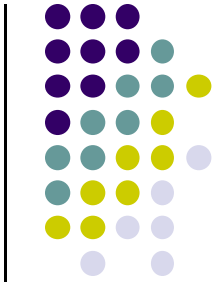


```
out vec3 T;
in vec4 vPosition;
in vec4 Normal;
uniform mat4 ModelView;
uniform mat4 Projection;

void main() {
    gl_Position = Projection*ModelView*vPosition;
    vec4 eyePos  = vPosition;                  // calculate view vector V
    vec4 NN = ModelView*Normal;       // transform normal
    vec3 N =normalize(NN.xyz);            // normalize normal
    T = refract(eyePos.xyz, N, iorefr);         // calculate refracted vector T
}
```

**Was previously** R = reflect(eyePos.xyz, N);

# Refraction Fragment Shader



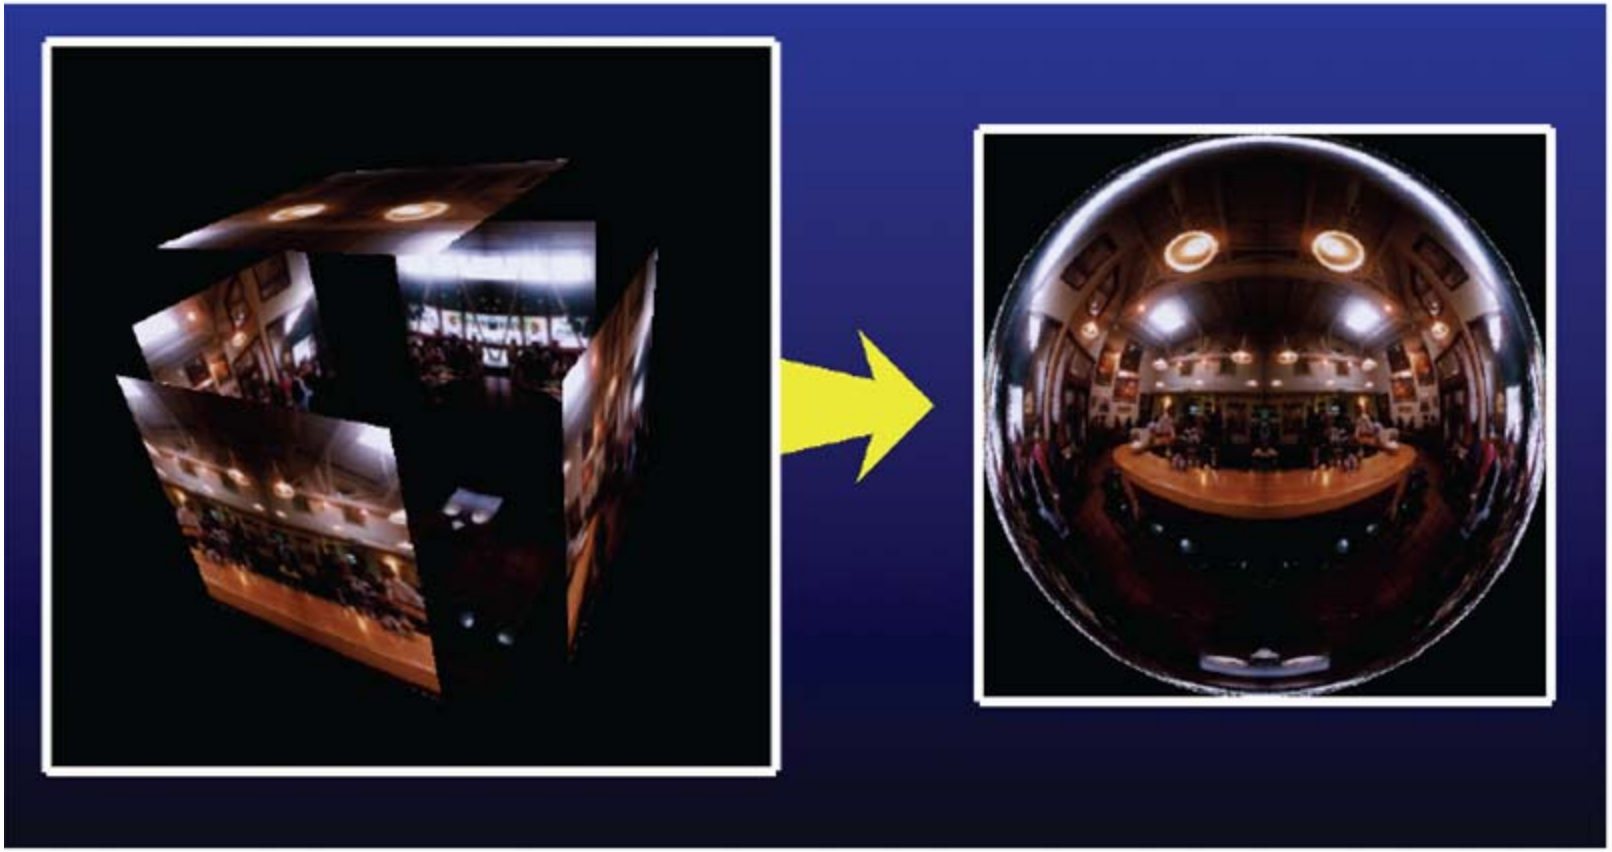
```
in vec3 T;
uniform samplerCube RefMap;

void main()
{
    vec4 refractColor = textureCube(RefMap, T);   // look up texture map using T
    refractcolor = mix(refractcolor, WHITE, 0.3);  // mix pure color with 0.3 white

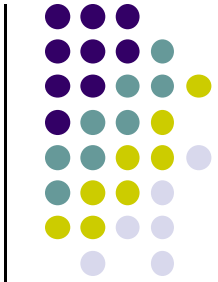
   gl_FragColor = texColor;
}
```

# Sphere Environment Map

- Cube can be replaced by a sphere (sphere map)



# Sphere Mapping



- Original environmental mapping technique
- Proposed by Blinn and Newell
- Uses lines of longitude and latitude to map parametric variables to texture coordinates
- OpenGL supports sphere mapping
- Requires a circular texture map equivalent to an image taken with a fisheye lens

# Sphere Map

- A sphere maps is basically a photograph of a reflective sphere in an environment

Paul DeBevec, www.debevec.org

# Sphere map

- example

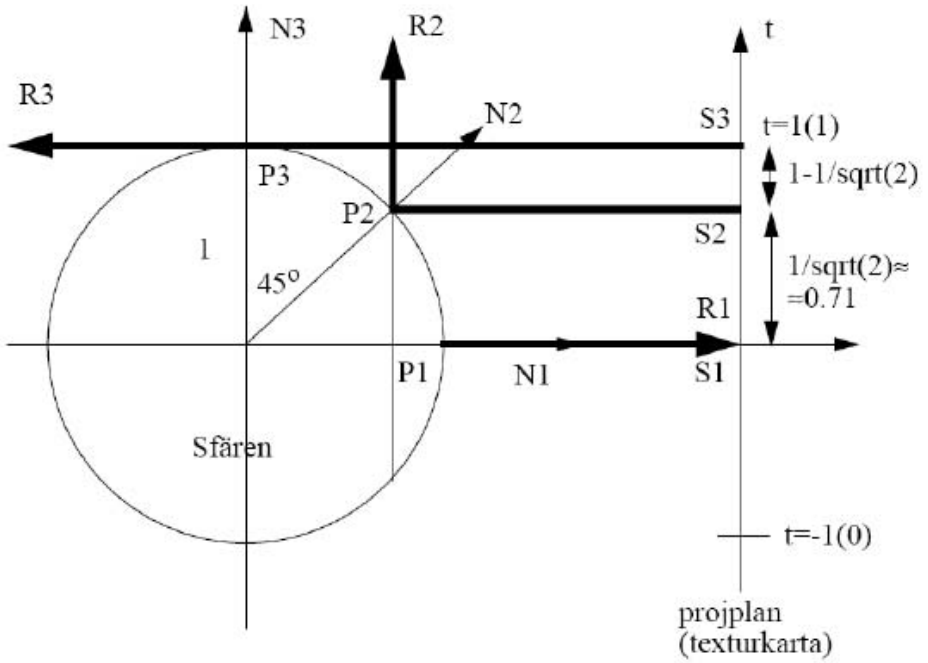
Sphere map
(texture)

Sphere map
applied on torus

# Capturing a Sphere Map

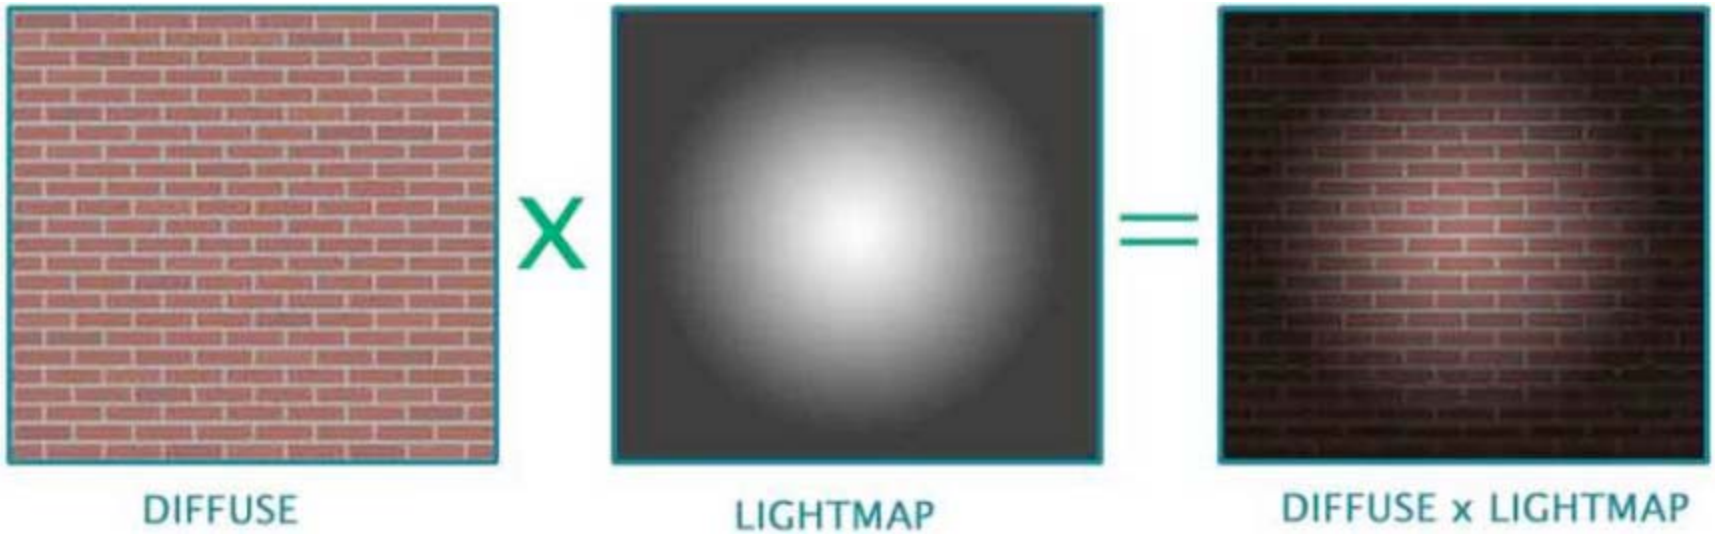
# Sphere Map

- Infinitesimally small reflective sphere (infinitely far away)
  - i.e., orthographic view of a reflective unit sphere
- Create by:
  - Photographing metal sphere
  - Ray tracing
  - Transforming cube map to sphere map

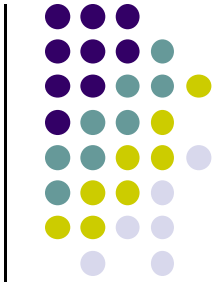


For derivation of sphere map, see section 7.8 of your text

# Light Maps

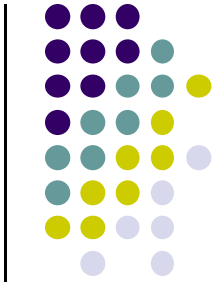


# Specular Mapping

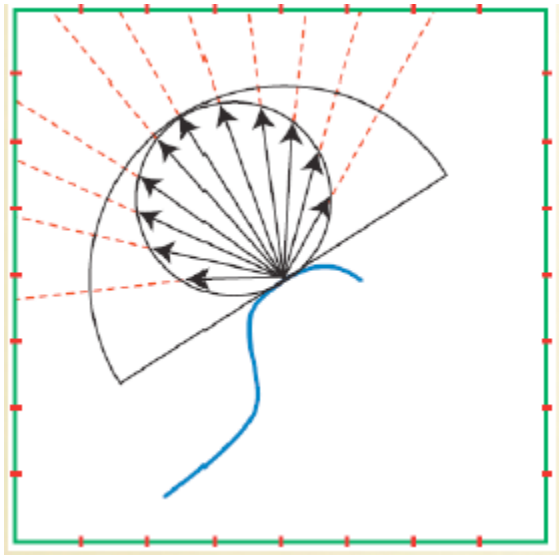


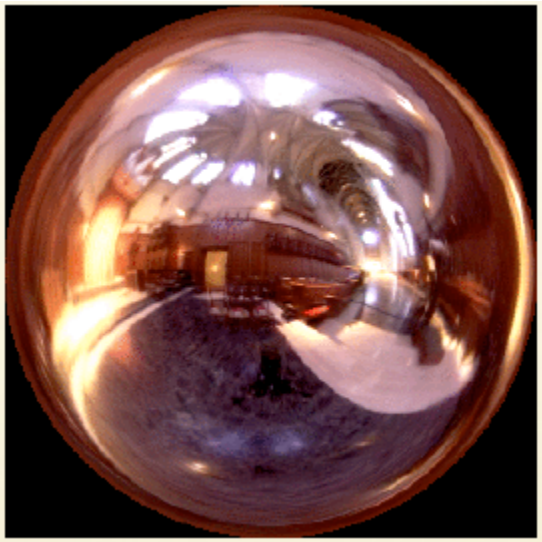
- Use a greyscale texture as a multiplier for the specular component

# Irradiance Mapping

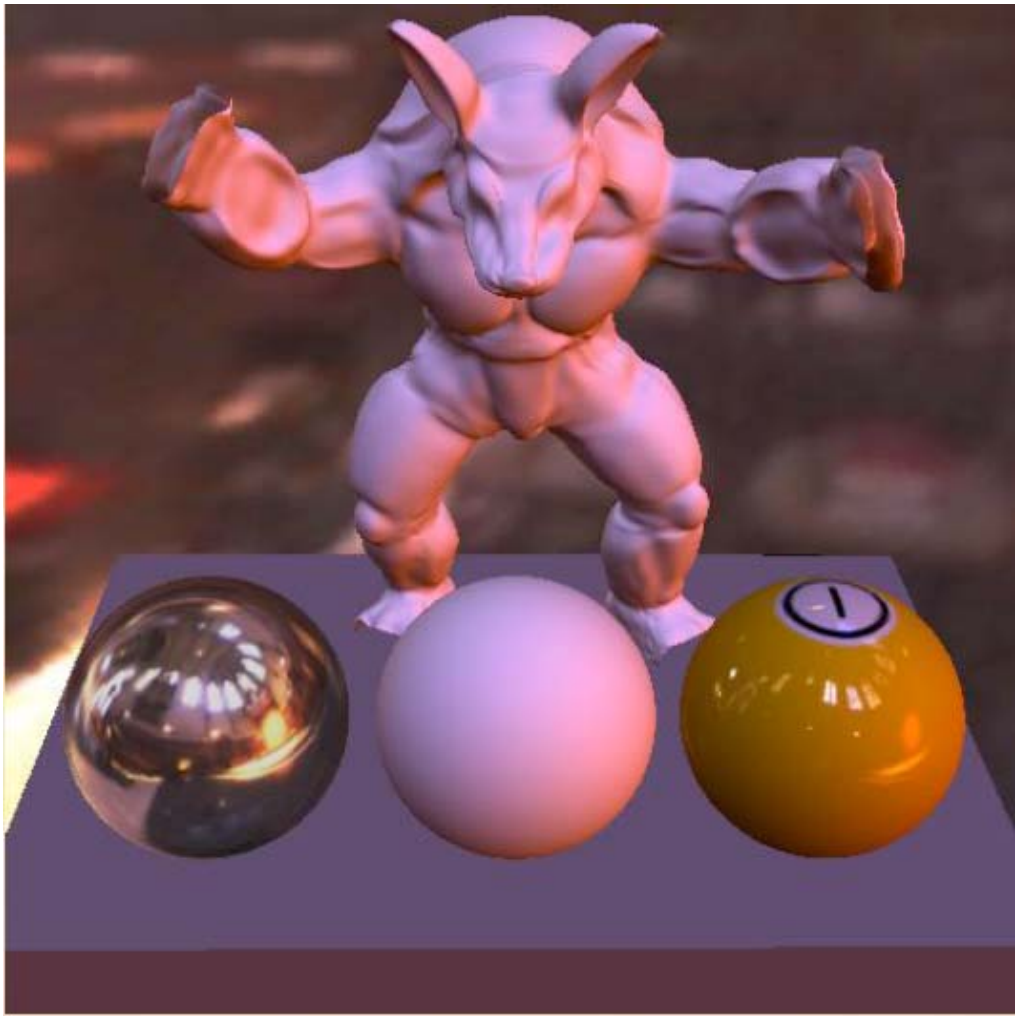


- You can reuse environment maps for diffuse reflections
- Integrate the map over a hemisphere at each pixel (basically blurs the whole thing out)



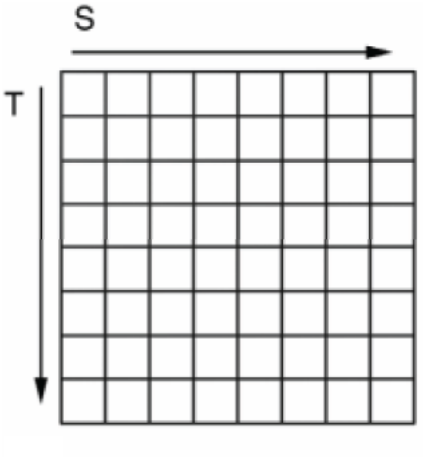


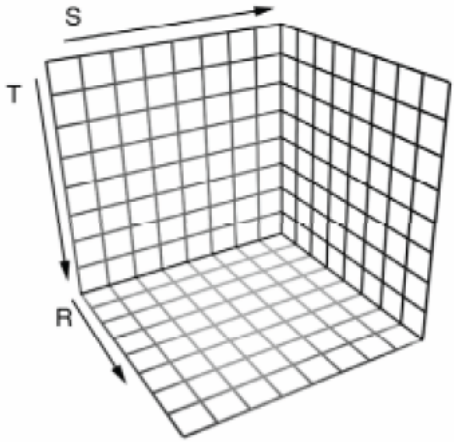
# Irradiance Mapping Example

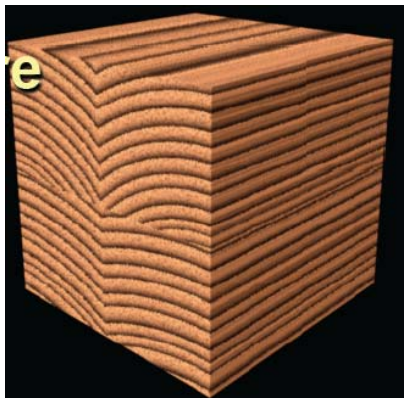


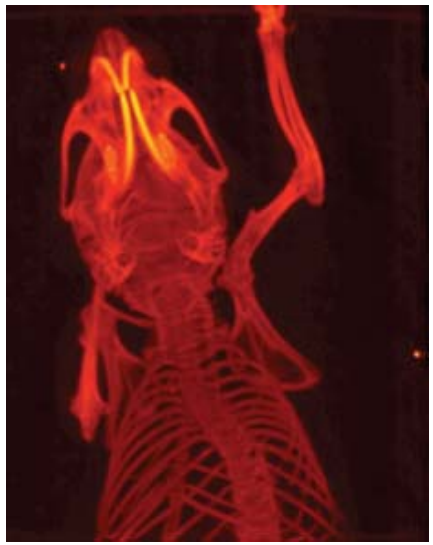
# 3D Textures

- 3D volumetric textures exist as well, though you can only render slices of them in OpenGL
- Generate a full image by stacking up slices in Z
- Used in visualization

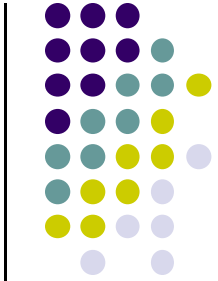




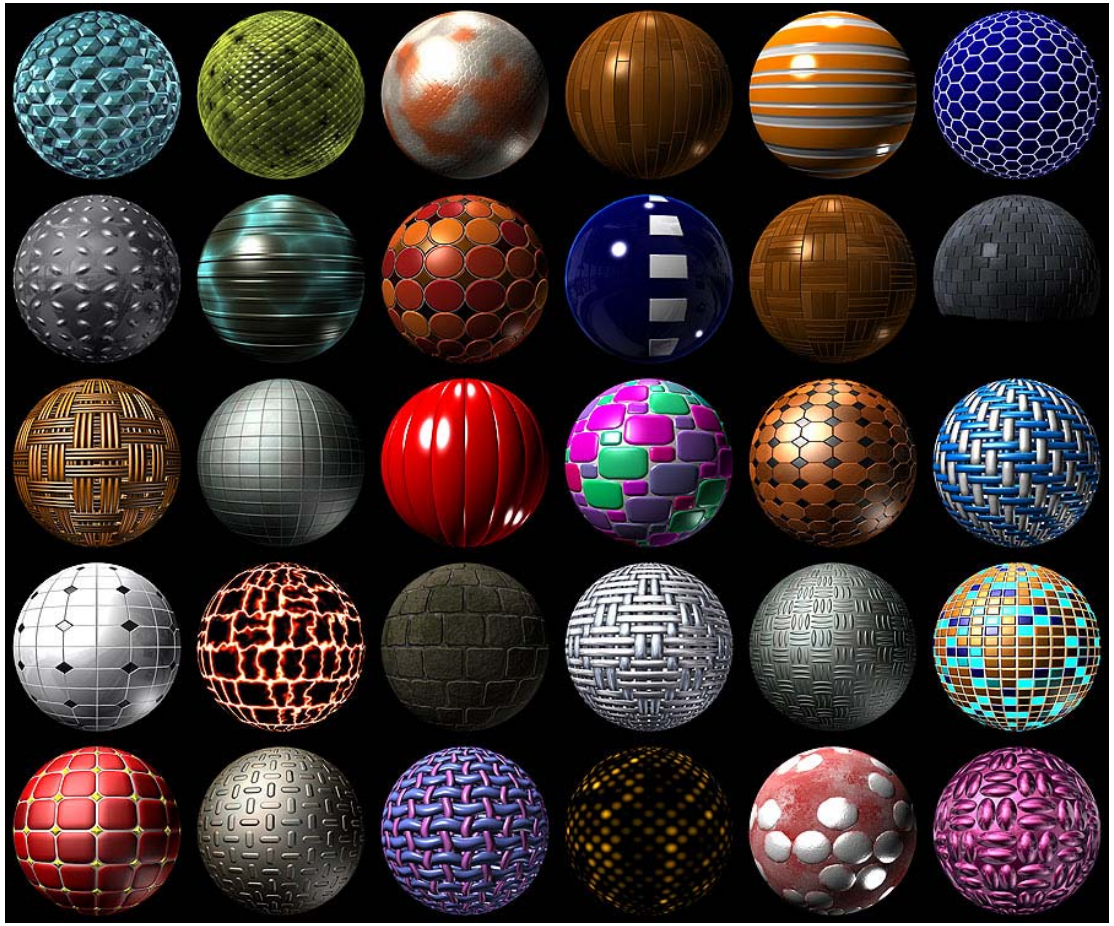




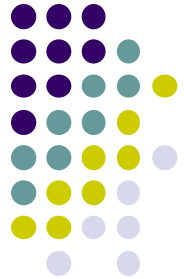
# Procedural Texturing



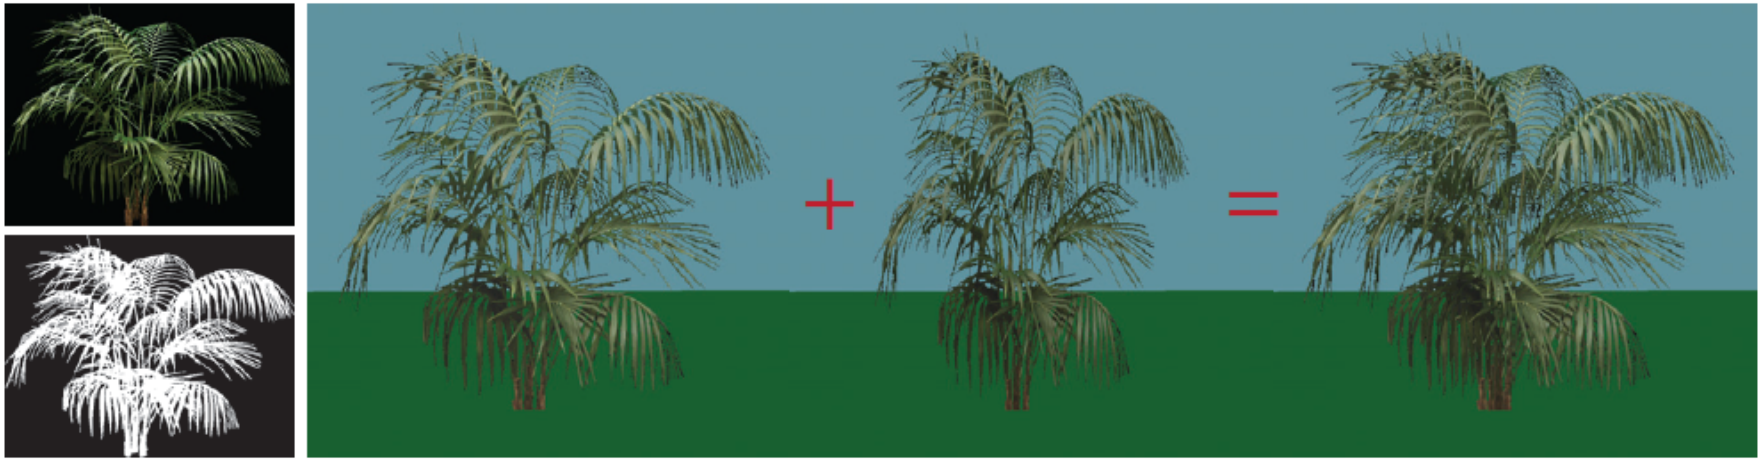
- Math functions that generate textures



# Alpha Mapping



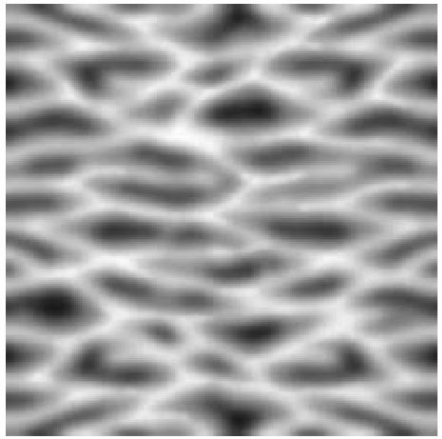
- Represent the alpha channel with a texture
- Can give complex outlines, used for plants

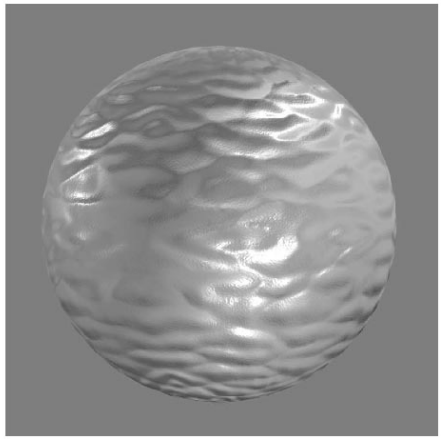


Render Bush
on 1 polygon

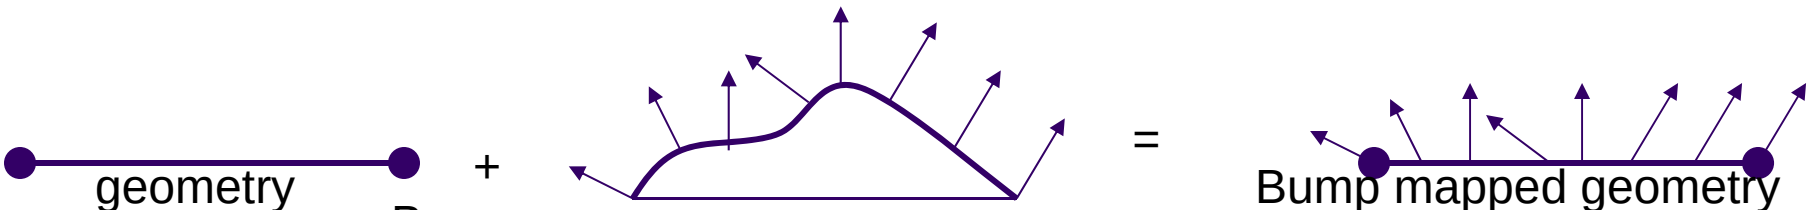
Render Bush
on polygon rotated
90 degrees

# Bump mapping

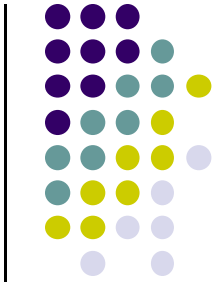




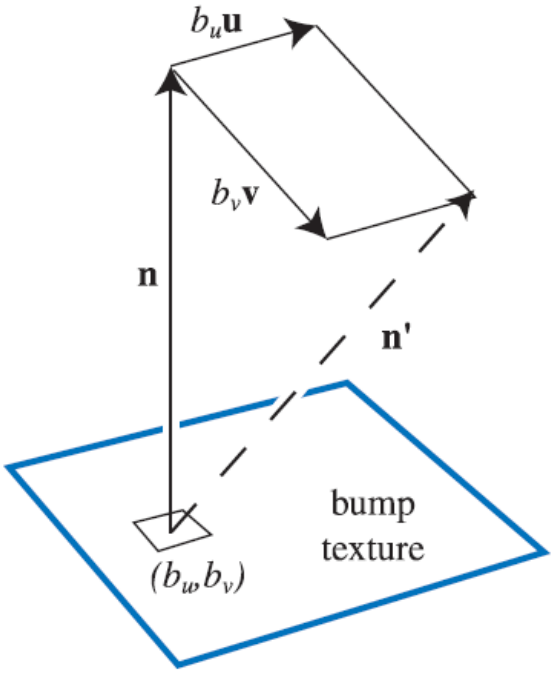
- by Blinn in 1978
- Inexpensive way of simulating wrinkles and bumps on geometry
  - Too expensive to model these geometrically
- Instead let a texture modify the normal at each pixel, and then use this normal to compute lighting

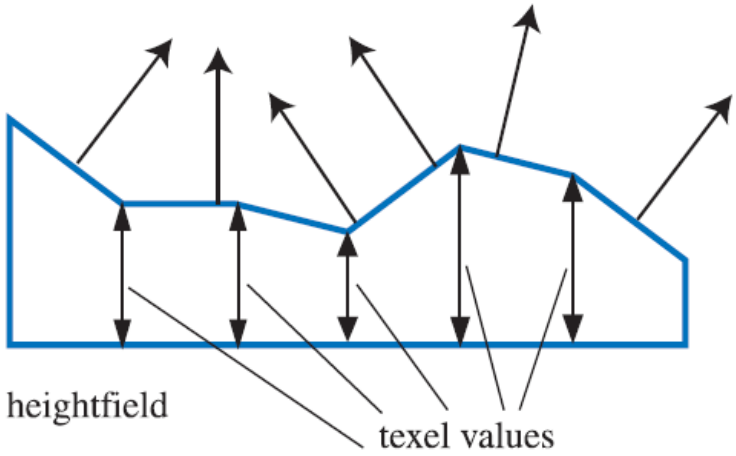


# Bump mapping: Blinn's method

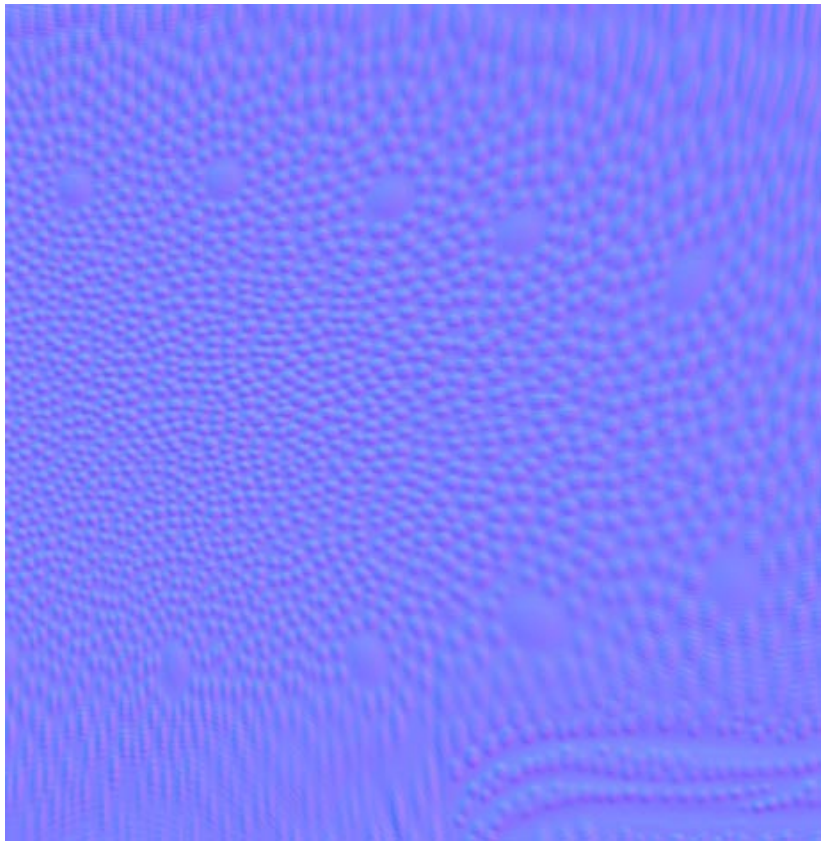


- Basic idea:
  - Distort the surface along the normal at that point
  - Magnitude is equal to value in heighfield at that location



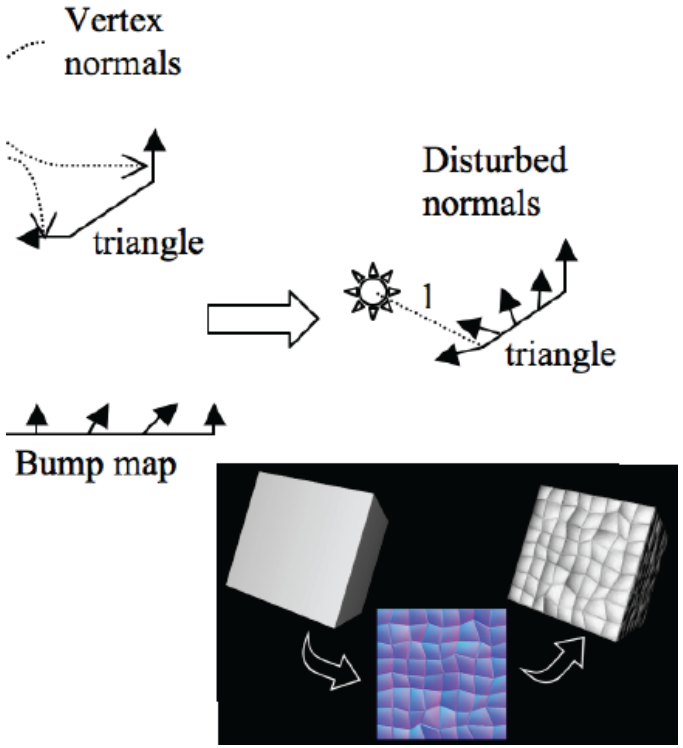


# Bump mapping: examples

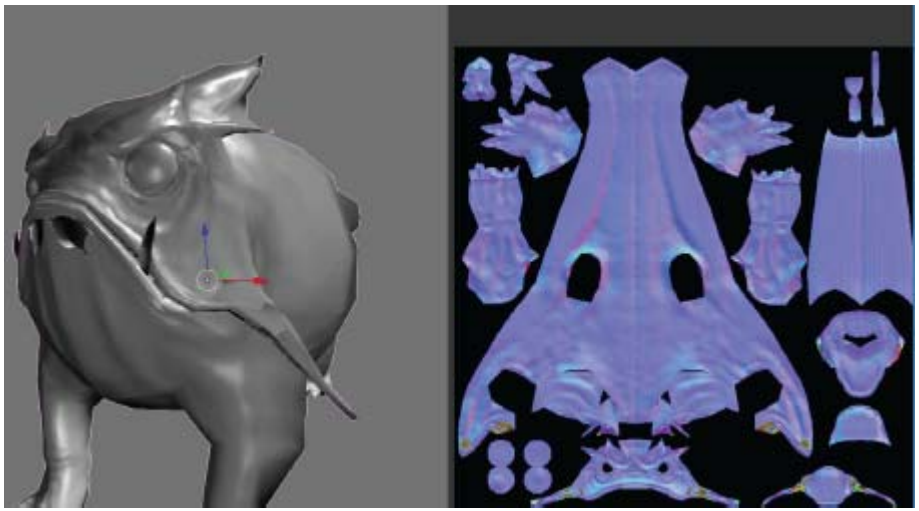


# Bump Mapping Vs Normal Mapping

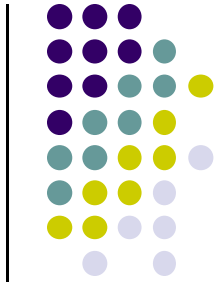
- **Bump mapping**
- (Normals $\mathbf{n}=(n_x, n_y, n_z)$ stored as *distortion of face orientation*. Same bump map can be tiled/repeated and reused for many faces)



- **Normal mapping**
- Coordinates of normal (relative to tangent space) are encoded in color channels
- Normals stored include face orientation + plus distortion. )

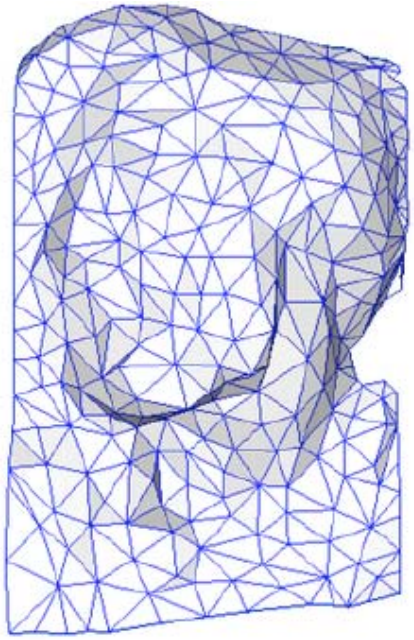


# Normal Mapping



- Very useful for making low-resolution geometry look like it's much more detailed

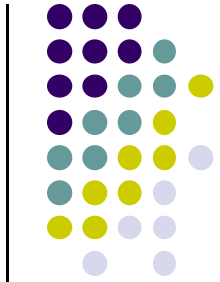
original mesh
4M triangles



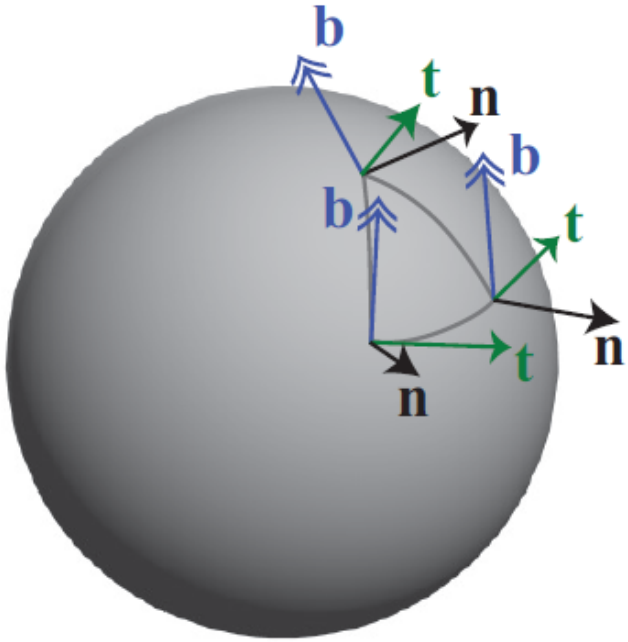
simplified mesh
500 triangles

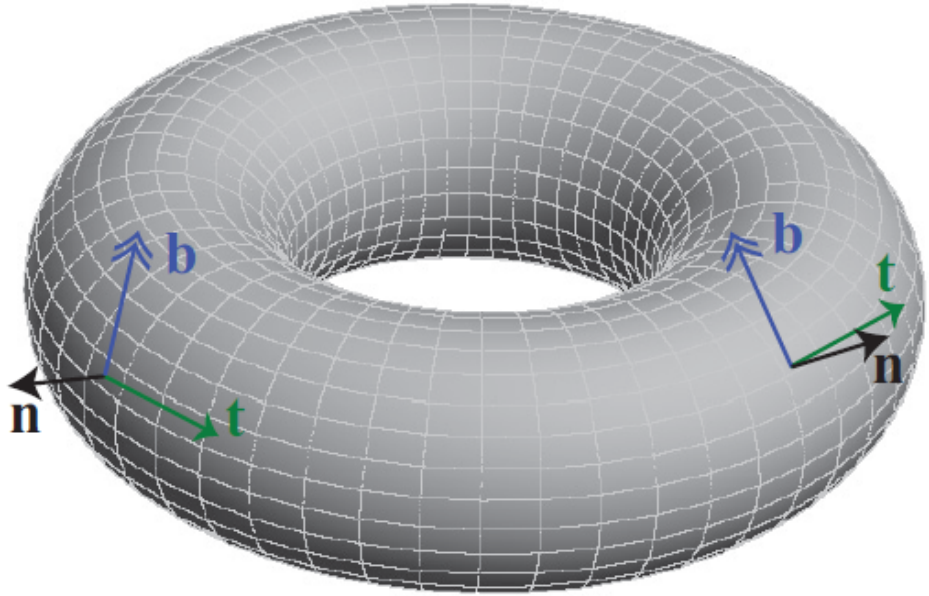
simplified mesh
and normal mapping
500 triangles

# Tangent Space Vectors



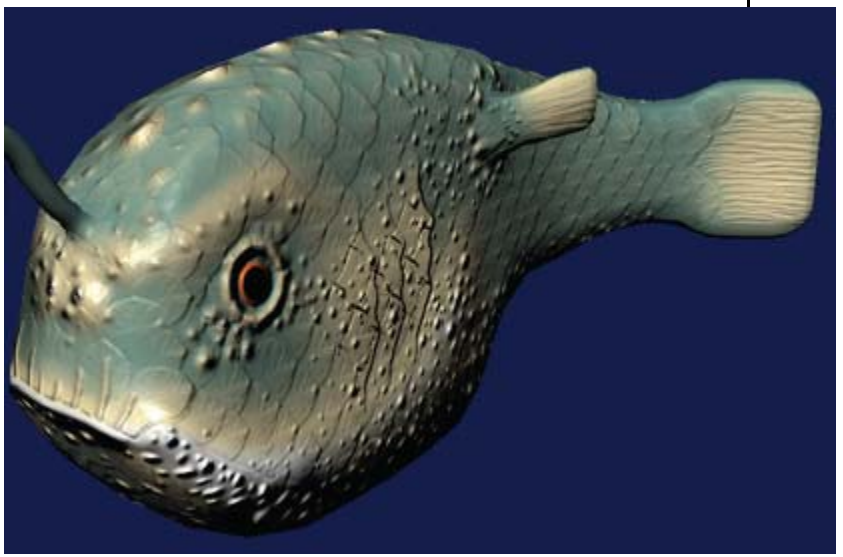
- Normals stored in local coordinate frame
- Need Tangent, normal and bi-tangent vectors

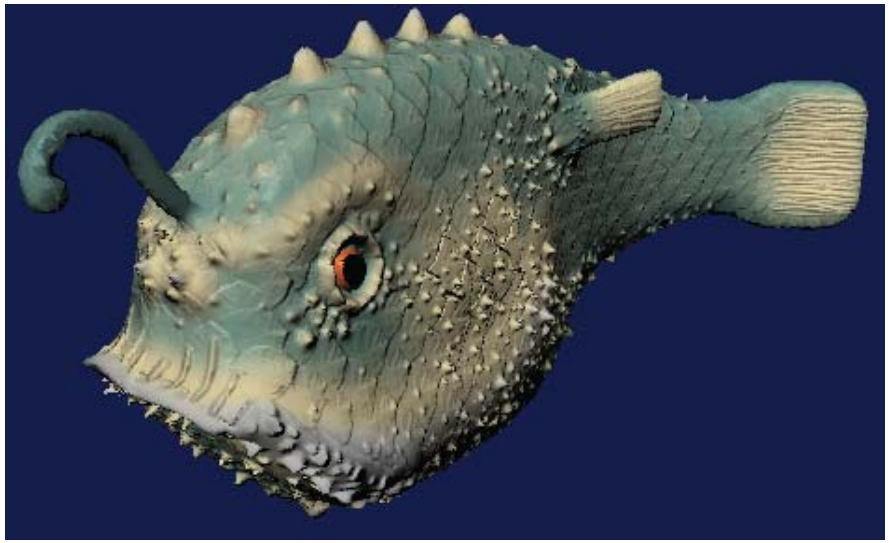




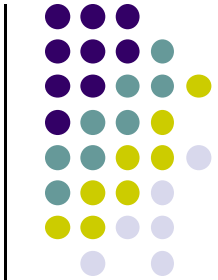
# Displacement Mapping

- Uses a map to displace the surface geometry at each position
- Offsets the position per pixel or per vertex
  - Offsetting per vertex is easy in vertex shader
  - Offsetting per pixel is architecturally hard

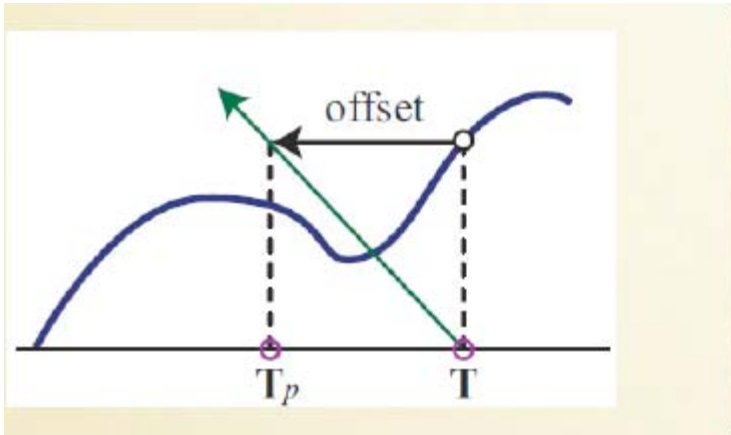




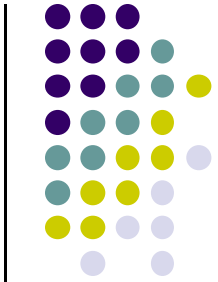
# Parallax Mapping



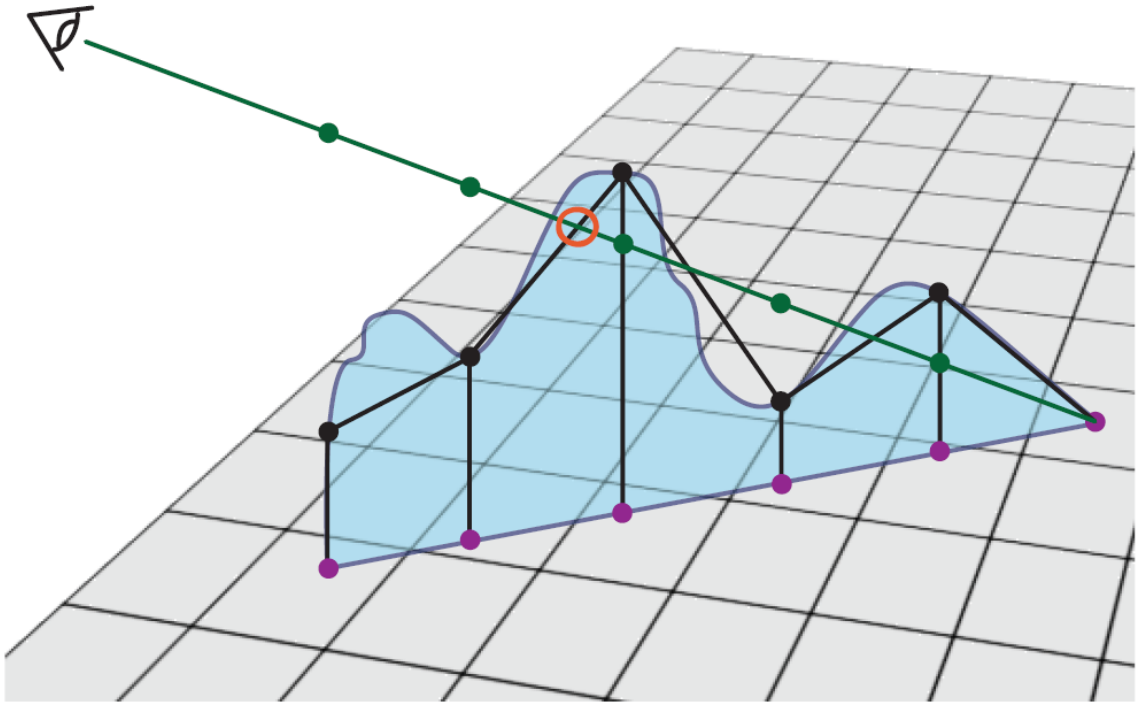
- Normal maps increase lighting detail, but they lack a sense of depth when you get up close
- Parallax mapping
  - simulates depth/blockage of one part by another
  - Uses heightmap to offset texture value / normal lookup
  - Different texture returned after offset



# Relief Mapping



- Implement a heightfield raytracer in a shader
- Pretty expensive, but looks amazing



# Relief Mapping Example
