

CS 403X Mobile and Ubiquitous Computing

Lecture 3: Introduction to Android Programming

Emmanuel Agu

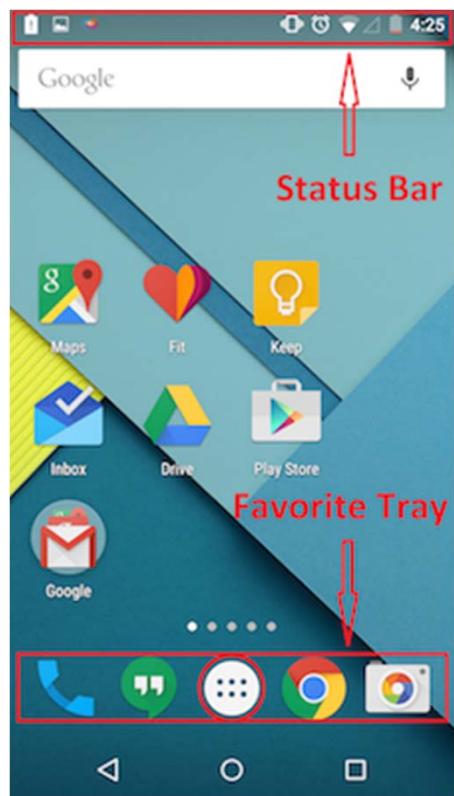

Android UI Tour

Home Screen

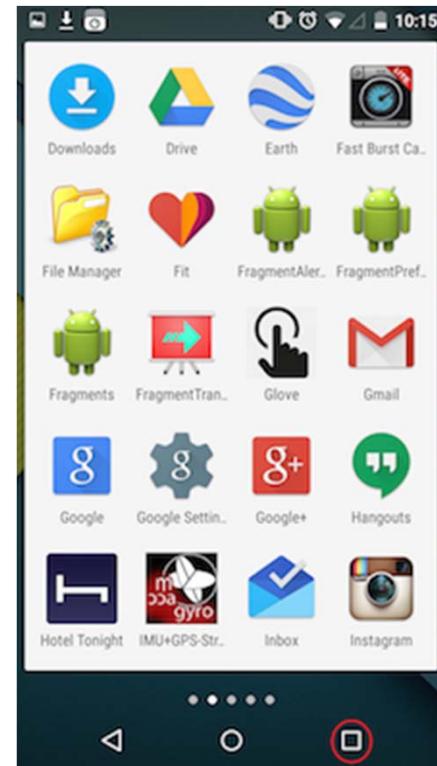

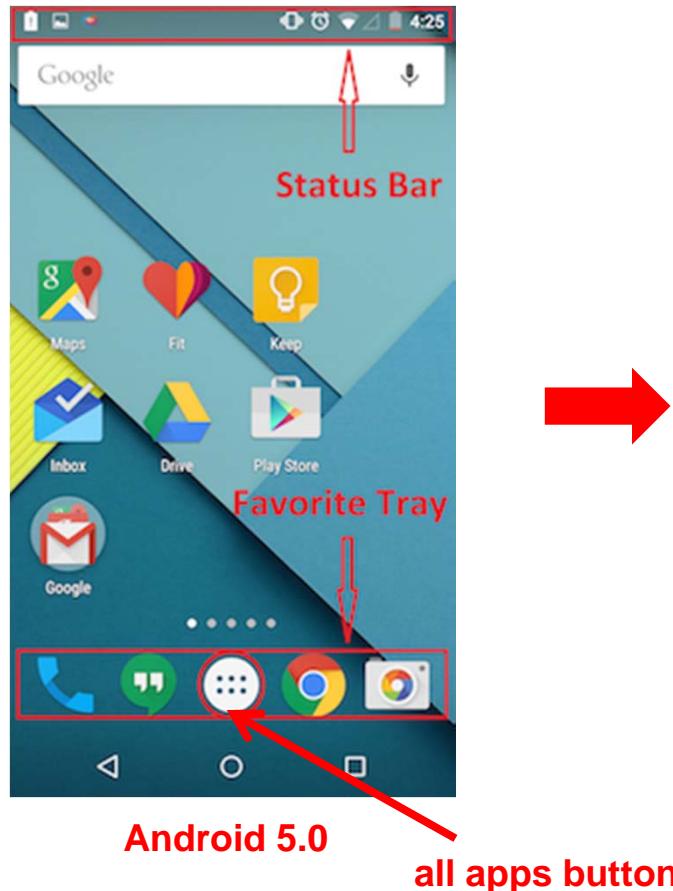

- First screen, includes **favorites** tray
(e.g phone, mail, messaging, web, etc)

All Apps Screen

- Accessed by touching **all apps button** in favorites tray
- Can swipe through multiple app screens, customizable

Android 5.0

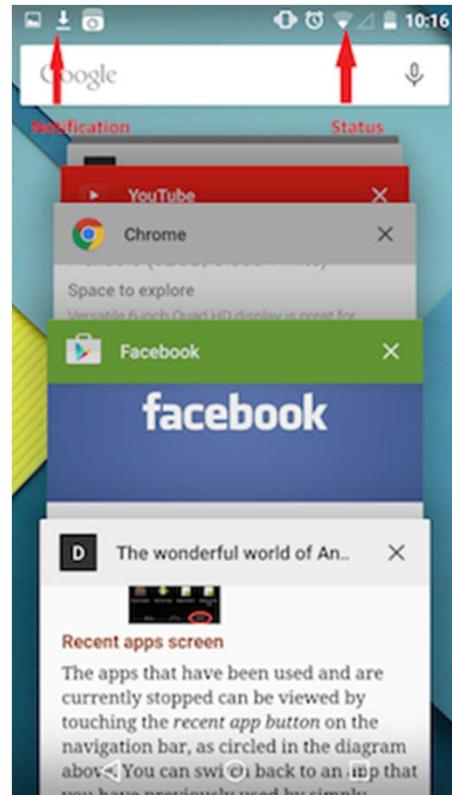

Recent Apps Screen

- Accessed by touching **recent apps button**
- Shows recently used apps, touch app to switch to it

recent apps button

Android 5.0

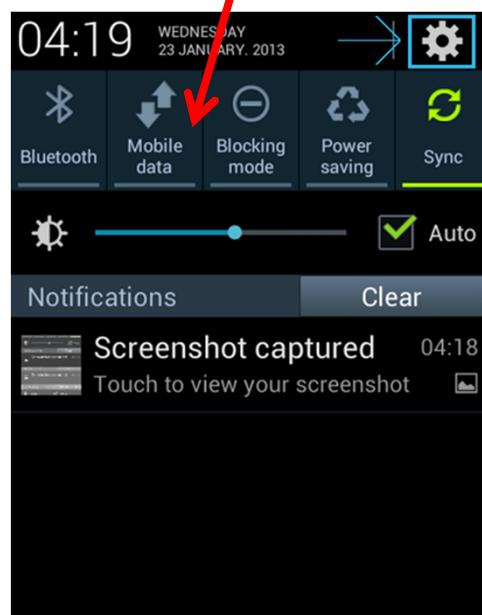

The apps that have been used and are currently stopped can be viewed by touching the *recent app button* on the navigation bar, as circled in the diagram above. You can swipe back to an app that you have previously used by simply

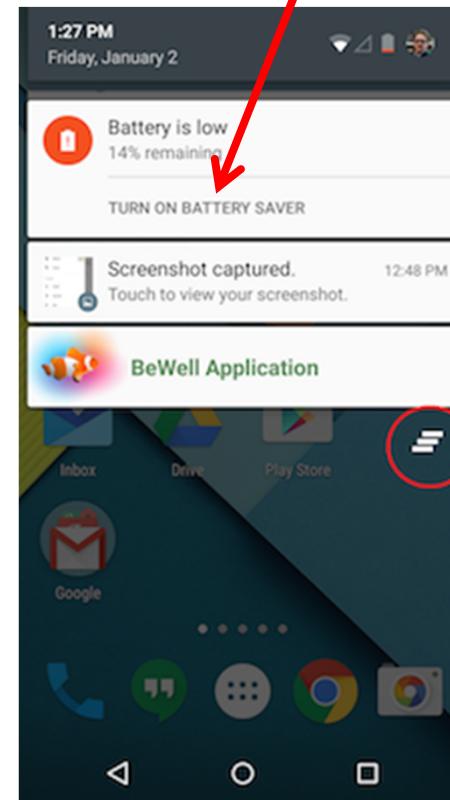

Status Bar and Notification Screen

- **Status:** time, battery, cell signal strength, bluetooth enabled, etc
- **Notification:** wifi, mail, bewell, voicemail, usb active, music, etc

Status bar

Notification Screen

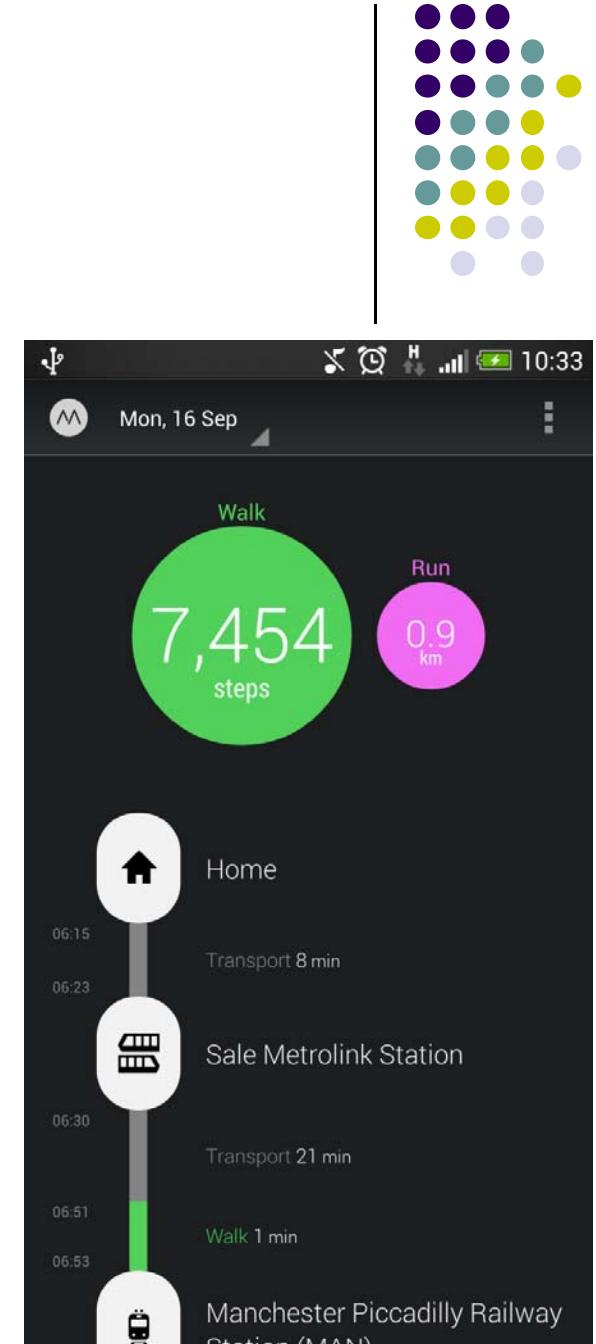

Android Apps: Big Picture

UI Design using XML

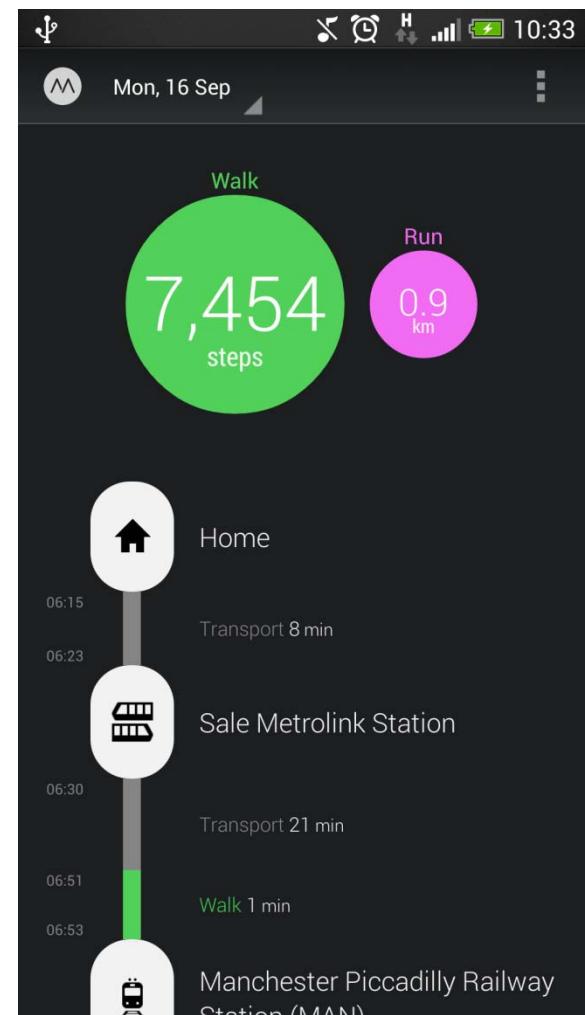

- UI design code (XML) separate from the program (Java)
- Why? Can modify UI without changing Java program
- **Example:** Shapes, colors can be changed in XML file without changing Java program
- UI designed using either:
 - Drag-and drop graphical (WYSIWYG) tool or
 - Programming Extensible Markup Language (XML)
- **XML:** Markup language, both human-readable and machine-readable"

Android App Compilation

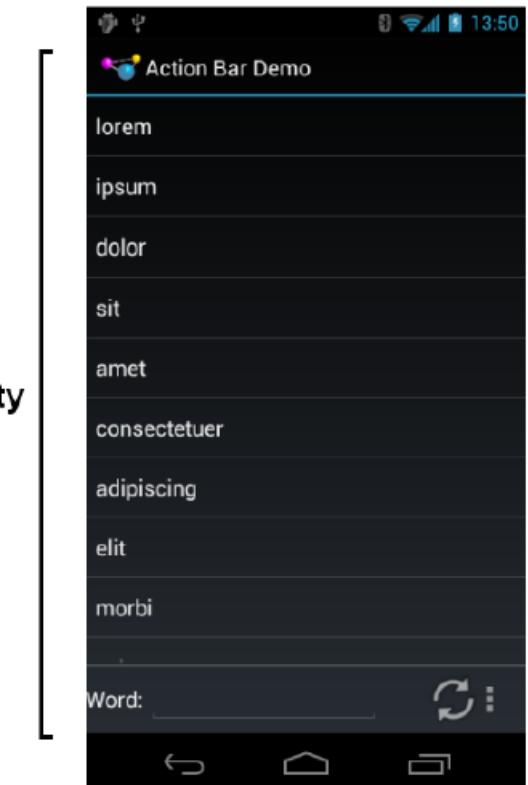

- Android Studio compiles code, data and resource files into **Android PackAge (filename.apk)**.
 - .apk is similar to .exe on Windows
- Apps download from Google Play, or copied to device as **filename.apk**
- Installation = installing **apk file**

Activities

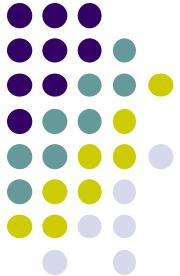

- Activity? 1 Android screen or dialog box
- Apps
 - Have at least 1 activity that deals with UI
 - Entry point, similar to **main()** in C
 - Typically have multiple activities
- Example: A camera app
 - **Activity 1:** to focus, take photo, launch activity 2
 - **Activity 2:** to view photo, save it
- Activities
 - independent of each other
 - E.g. Activity 1 can write data, read by activity 2
 - App Activities derived from Android's **Activity** class

Our First Android App

3 Files in “Hello World” Android Project

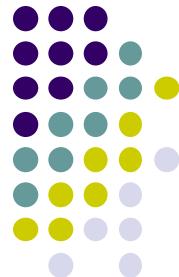

- **Activity_my.xml:** XML file specifying screen layout
- **MainActivity.Java:** Java code to define behavior, actions taken when button clicked (intelligence)
- **AndroidManifest.xml:**
 - Lists all screens, components of app
 - Analogous to a table of contents for a book
 - E.g. Hello world program has 1 screen, so AndroidManifest.xml has 1 item listed
 - App starts running here (like main() in C)
- **Note:** Android Studio creates these 3 files for you

Execution Order

Next: Samples of AndroidManifest.xml
Hello World program

Start in **AndroidManifest.xml**
Read list of activities (screens)
Start execution from Activity
tagged Launcher

Create/execute activities
(declared in java files)
E.g. **MainActivity.Java**

Format each activity using layout
In XML file (e.g. **Activity_my.xml**)

Inside “Hello World” AndroidManifest.xml

This file is written using xml namespace and tags and rules for android

Your
package
name

Android
version

List of
activities
(screens)
in your app

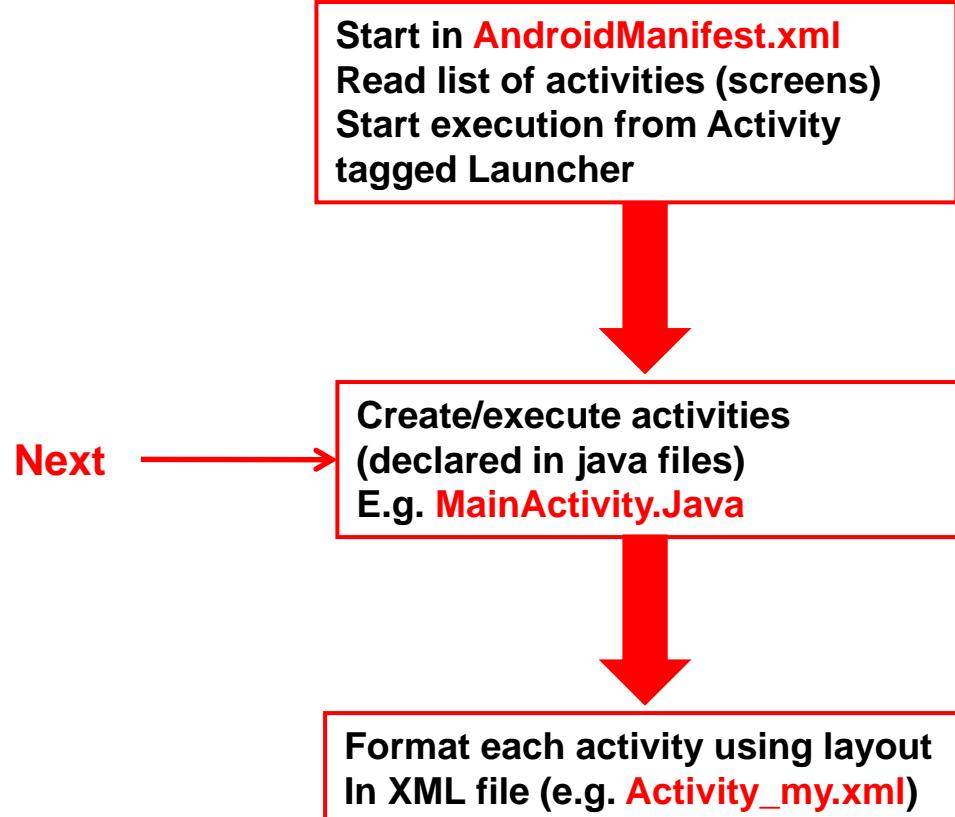

```
<?xml version="1.0"?>
<manifest xmlns:android="http://schemas.android.com/apk/res/android"
    package="com.commonsware.android.skeleton"
    android:versionCode="1"
    android:versionName="1.0">

    <application>
        <activity
            android:name="Now"
            android:label="Now">
            <intent-filter>
                <action android:name="android.intent.action.MAIN" />

                <category android:name="android.intent.category.LAUNCHER" />
            </intent-filter>
        </activity>
    </application>
</manifest>
```

One activity (screen)
designated LAUNCHER.
The app starts running here

Execution Order

Example Activity Java file (E.g. MainActivity.java)

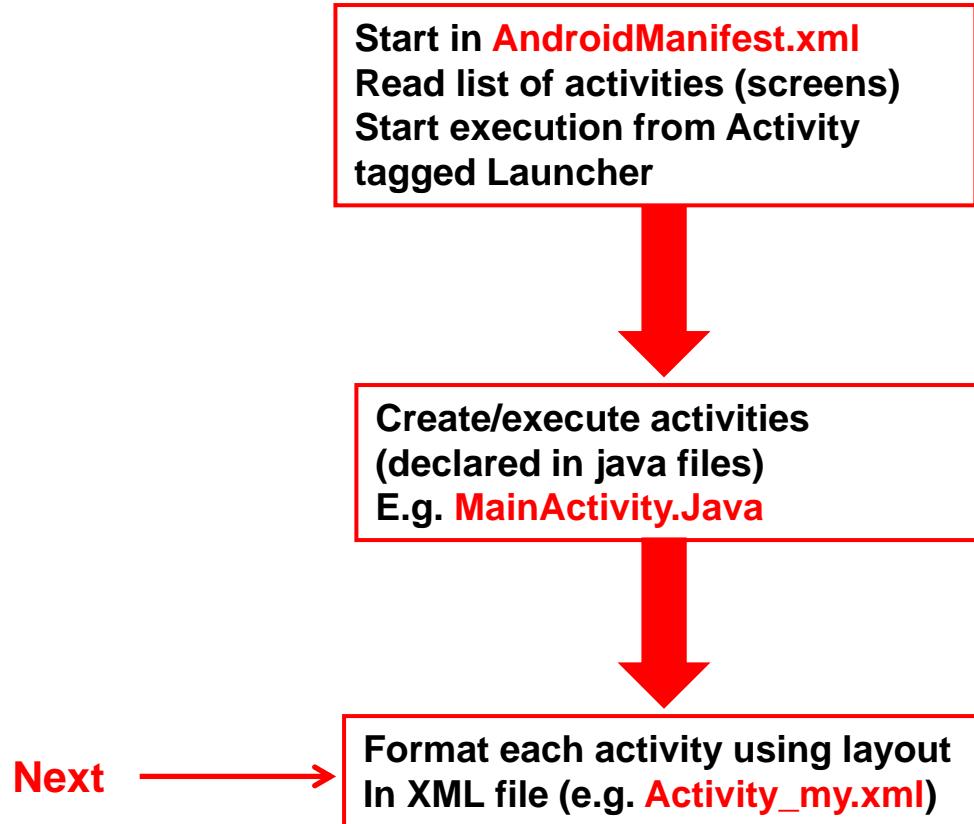

```
Package declaration → package com.commonsware.empublite;  
  
Import needed classes → import android.app.Activity;  
My class inherits from → import android.os.Bundle;  
Android activity class → public class EmPubLiteActivity extends Activity {  
    @Override  
    protected void onCreate(Bundle savedInstanceState) {  
        super.onCreate(savedInstanceState);  
        setContentView(R.layout.main);  
    }  
}
```

Note: Android calls your Activity's onCreate method once it is created

Use screen layout (design)
declared in file main.xml

Execution Order

Simple XML file Designing UI

- After choosing the layout, then widgets added to design UI
- XML Layout files consist of:
 - UI components (boxes) called **Views**
 - Different types of views. E.g
 - TextView**: contains text,
 - ImageView**: picture,
 - WebView**: web page
 - Views** arranged into layouts or **ViewGroups**

```
<RelativeLayout xmlns:android="http://schemas.android.com/apk/res/android"  
    xmlns:tools="http://schemas.android.com/tools"  
    android:layout_width="match_parent"  
    android:layout_height="match_parent"  
    tools:context=".EmPubLiteActivity">  
  
    <TextView  
        android:layout_width="wrap_content"  
        android:layout_height="wrap_content"  
        android:layout_centerHorizontal="true"  
        android:layout_centerVertical="true"  
        android:text="@string/hello_world"/>  
  
</RelativeLayout>
```

Declare Layout

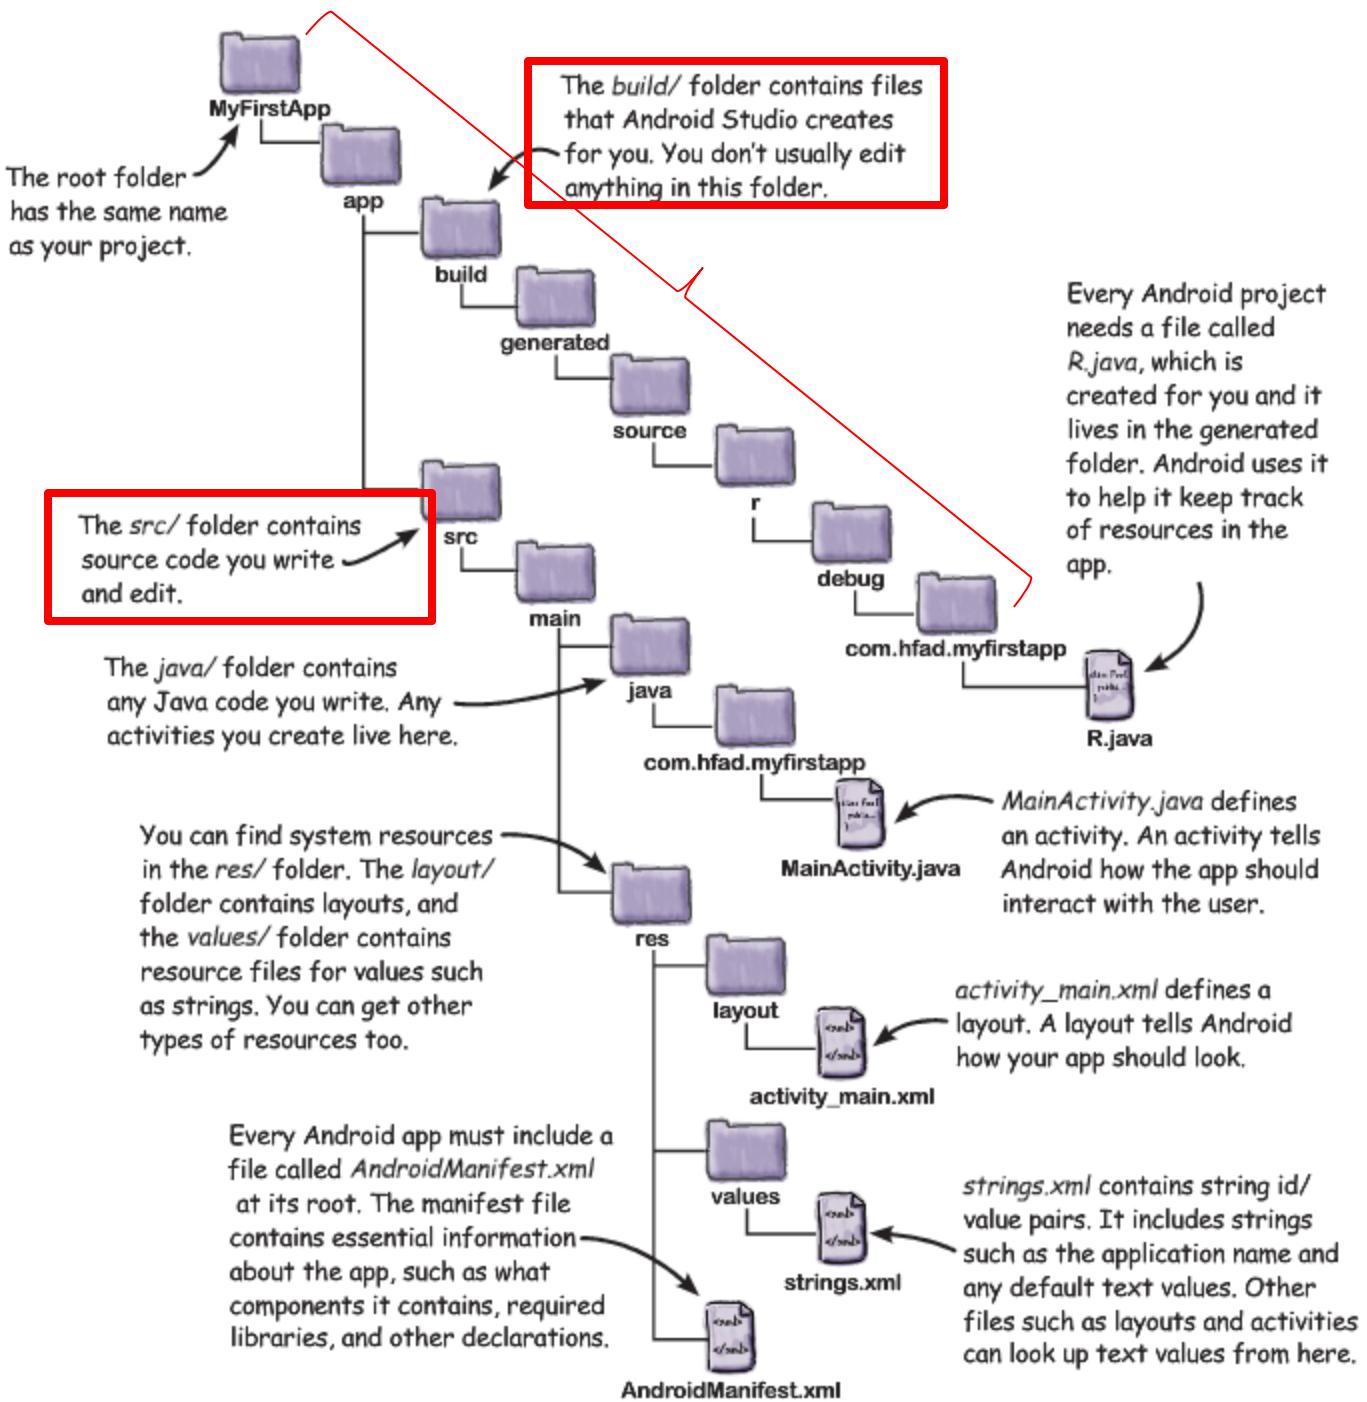

Add widgets

Widget properties
(e.g. center contents
horizontally and vertically)

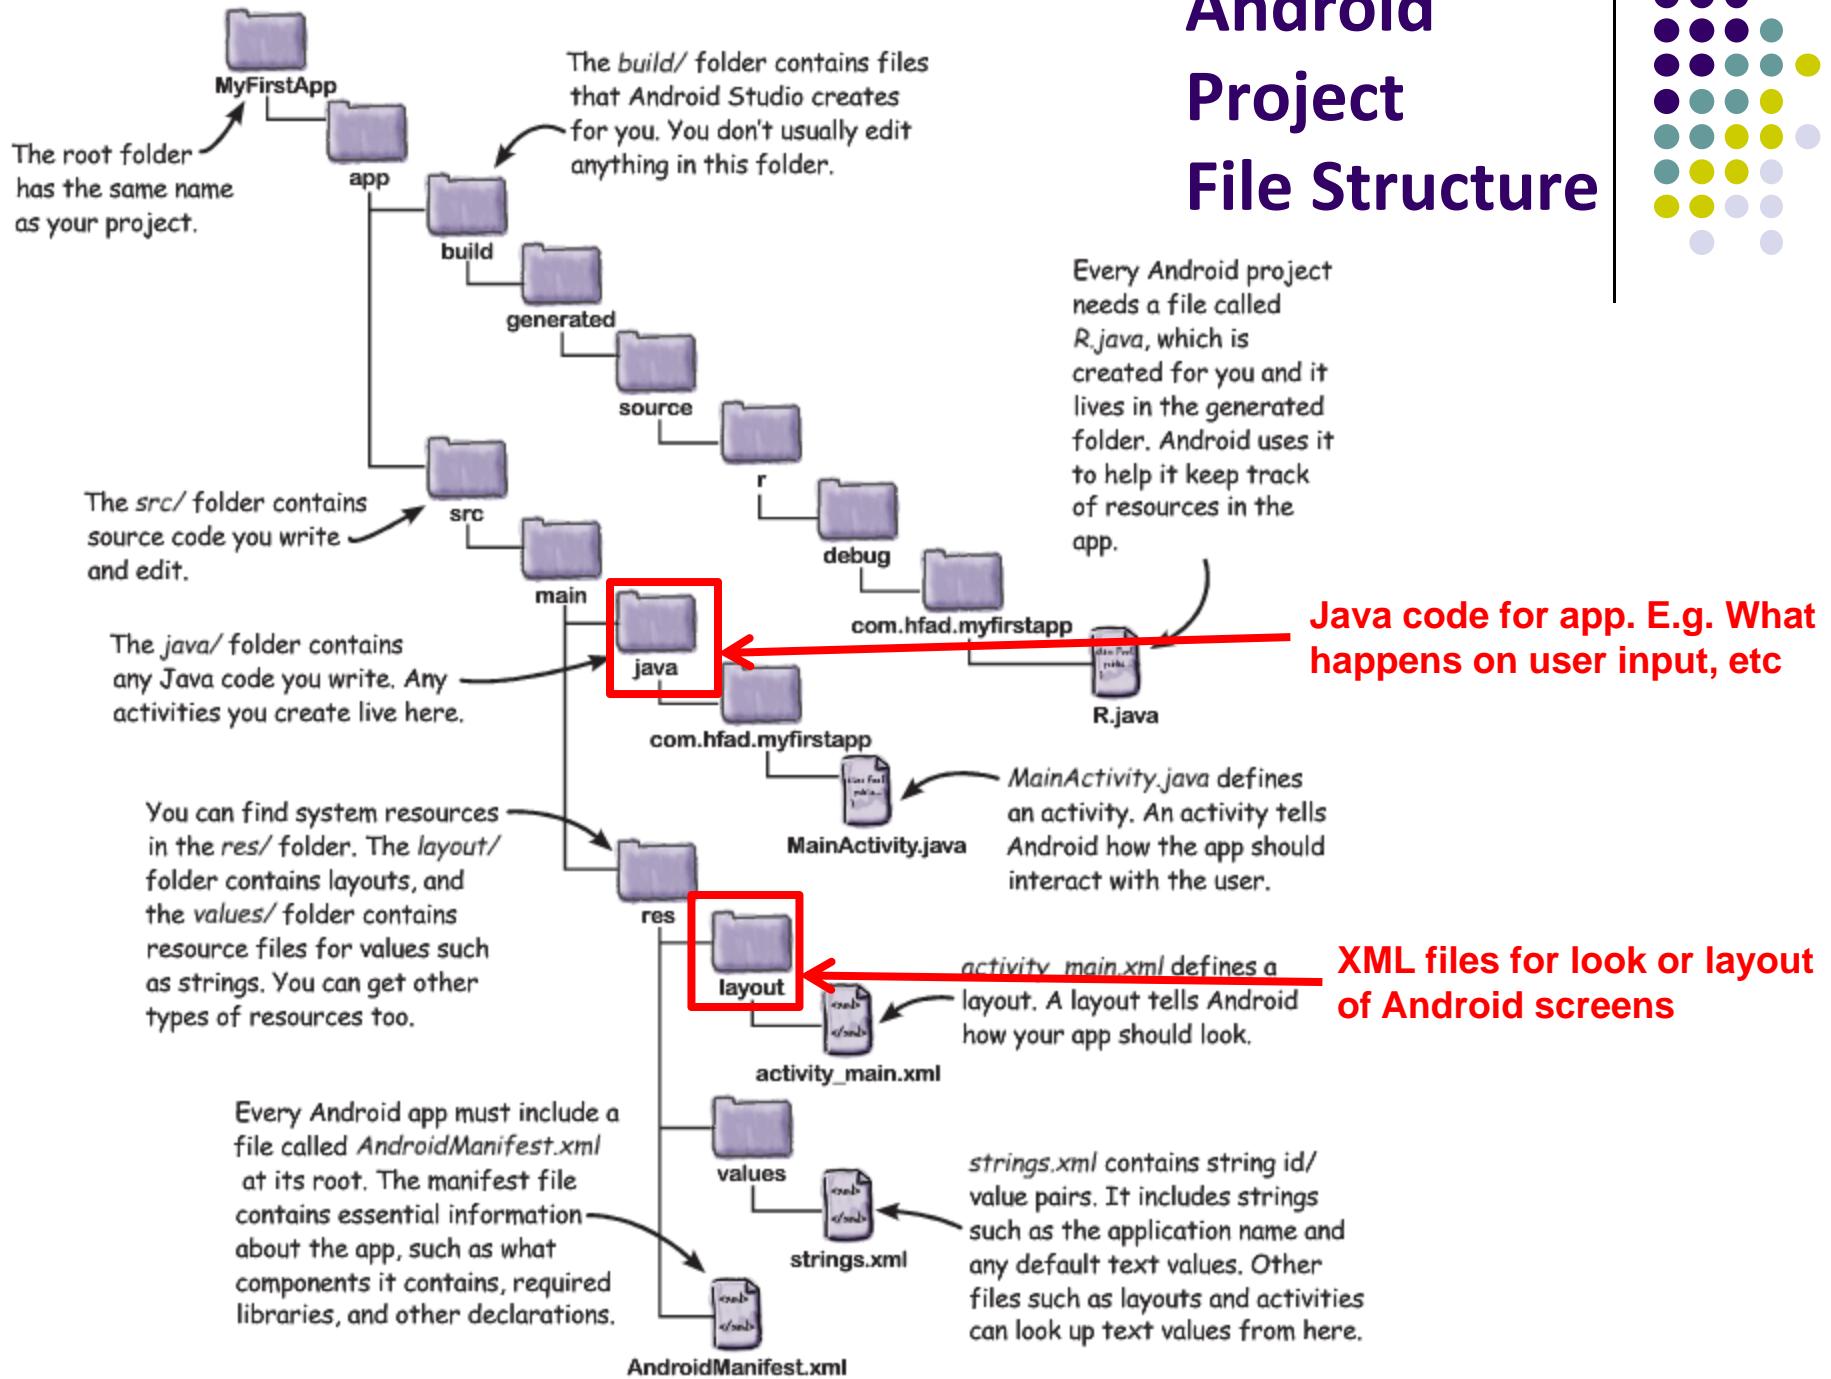

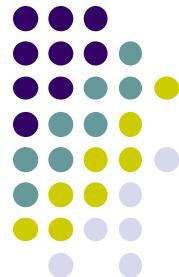

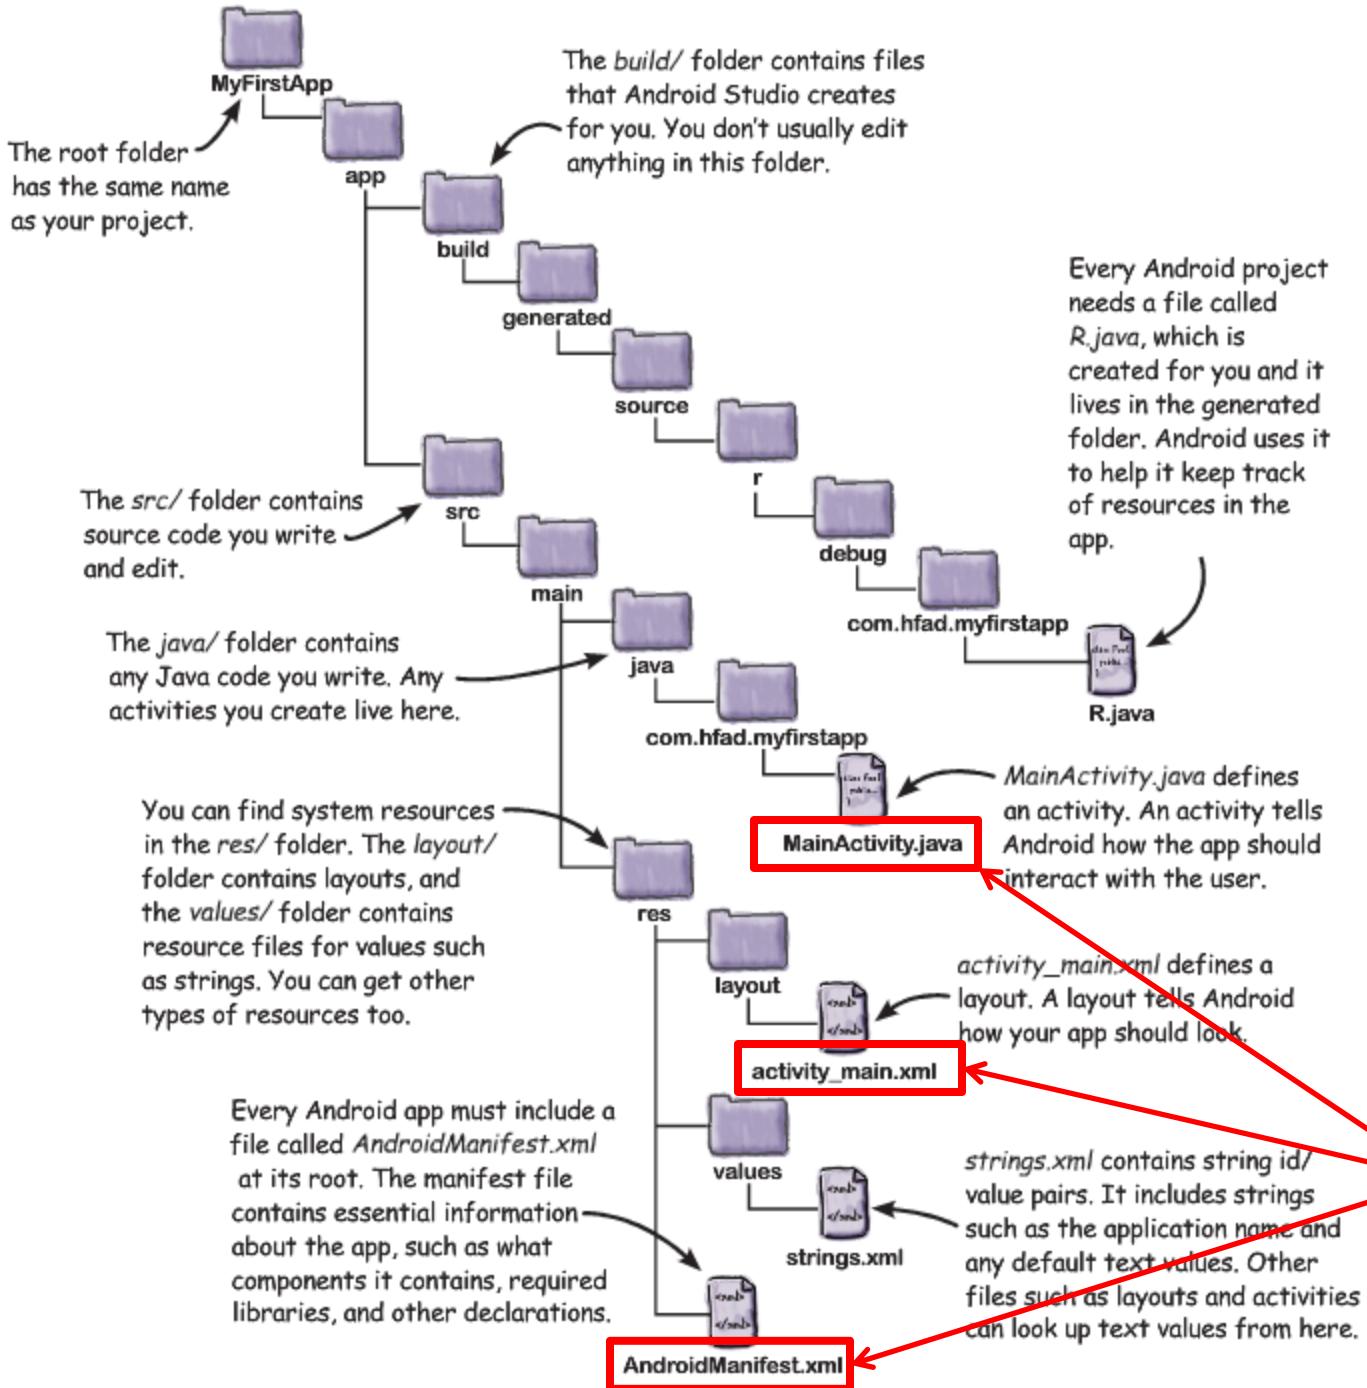

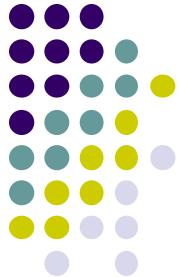

Android Files

Android Project File Structure

Android Project File Structure

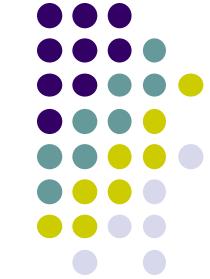

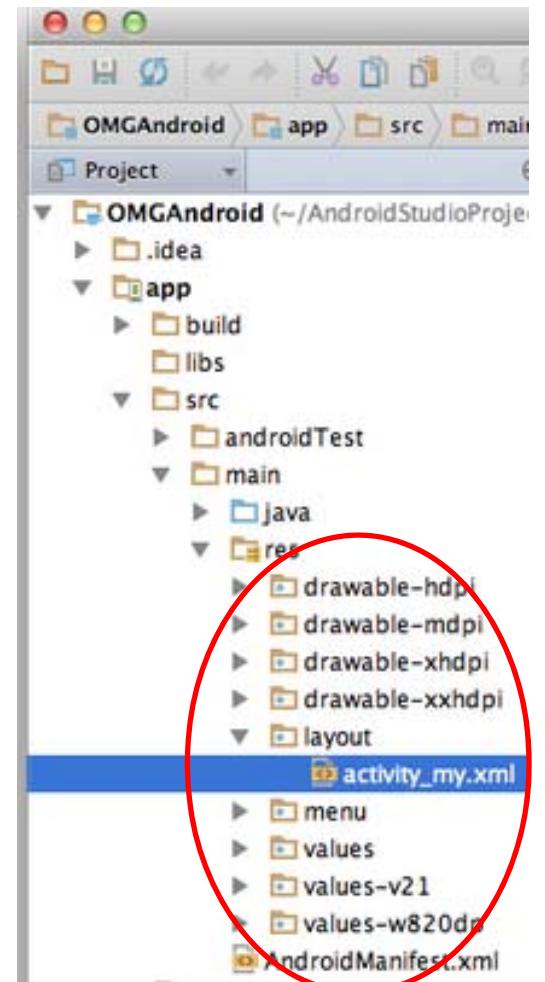

Android Project File Structure

3 Main Files to Write Android app

Files in an Android Project

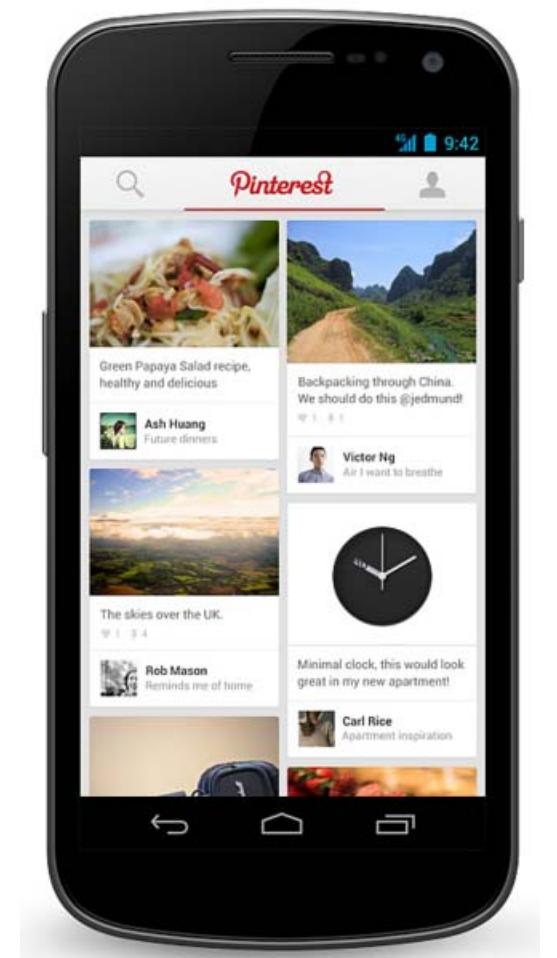

- **res/** folder contains static resources you can embed in Android screen (e.g. pictures, string declarations, etc)
- **res/menu/**: XML files for menu specs
- **res/drawable-xyz/**: images (PNG, JPEG, etc) at various resolutions
- **res/raw**: general-purpose files (e.g. audio clips, CSV files)
- **res/values/**: strings, dimensions, etc

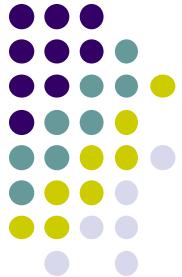

Concrete Example: Files in an Android Project

- **res/layout:** layout, dimensions (width, height) of screen cells are specified in XML file here
- **res/drawable-xyz/:** The images stored in jpg or other format here
- **java/:** App's behavior when user clicks on a selection in java file here
- **AndroidManifest.XML:** Contains app name (Pinterest), list of app screens, etc

Basic Overview of an App

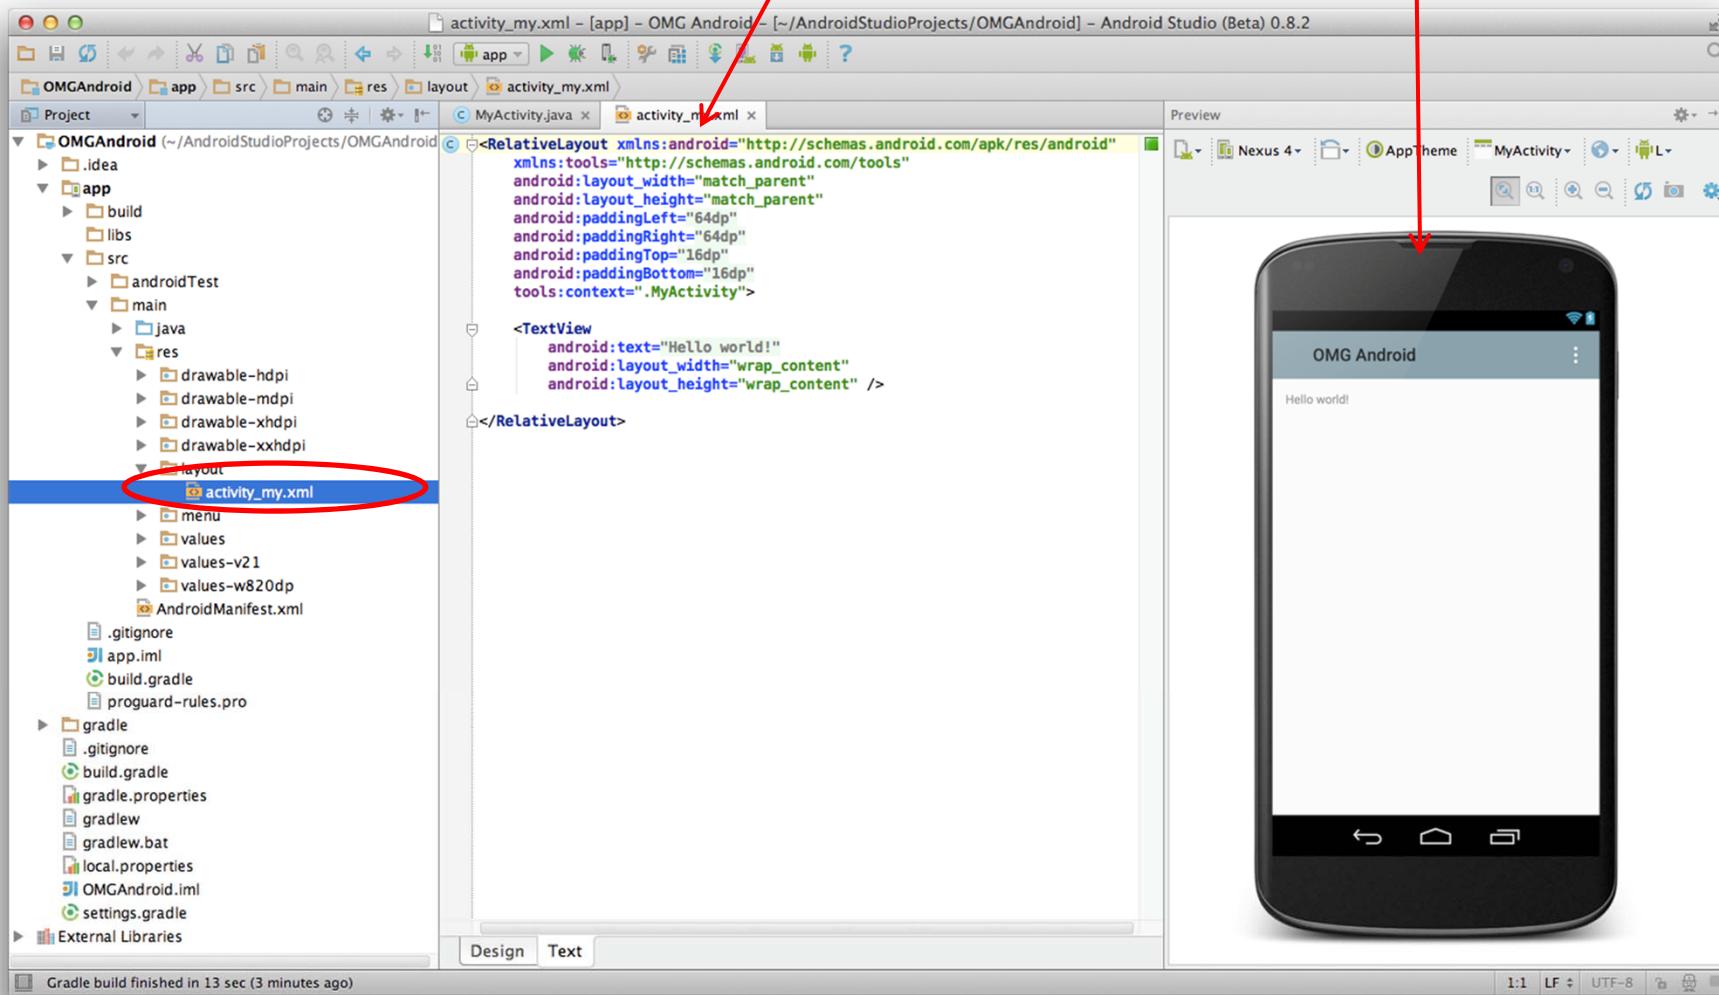

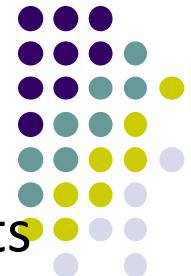

- Tutorial 8: Basic Overview of an App [11:36 mins]
 - <https://www.youtube.com/watch?v=9l1lfWAiHPg>
- Main topics
 - Introduces main files of Android App
 - Activity_main.xml
 - MainActivity.java
 - AndroidManifest.xml
 - How to work with these files within Android Studio
 - Editing files using either drag-and-drop interface or XML
 - Flow of basic app

Editting Android

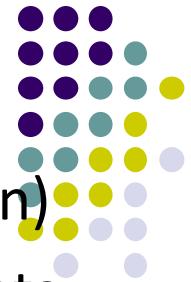

- Activity_my.xml is XML file specifying screen layout, widgets
- Can edit XML directly or drag and drop

Activity_my.xml
(can edit directly)

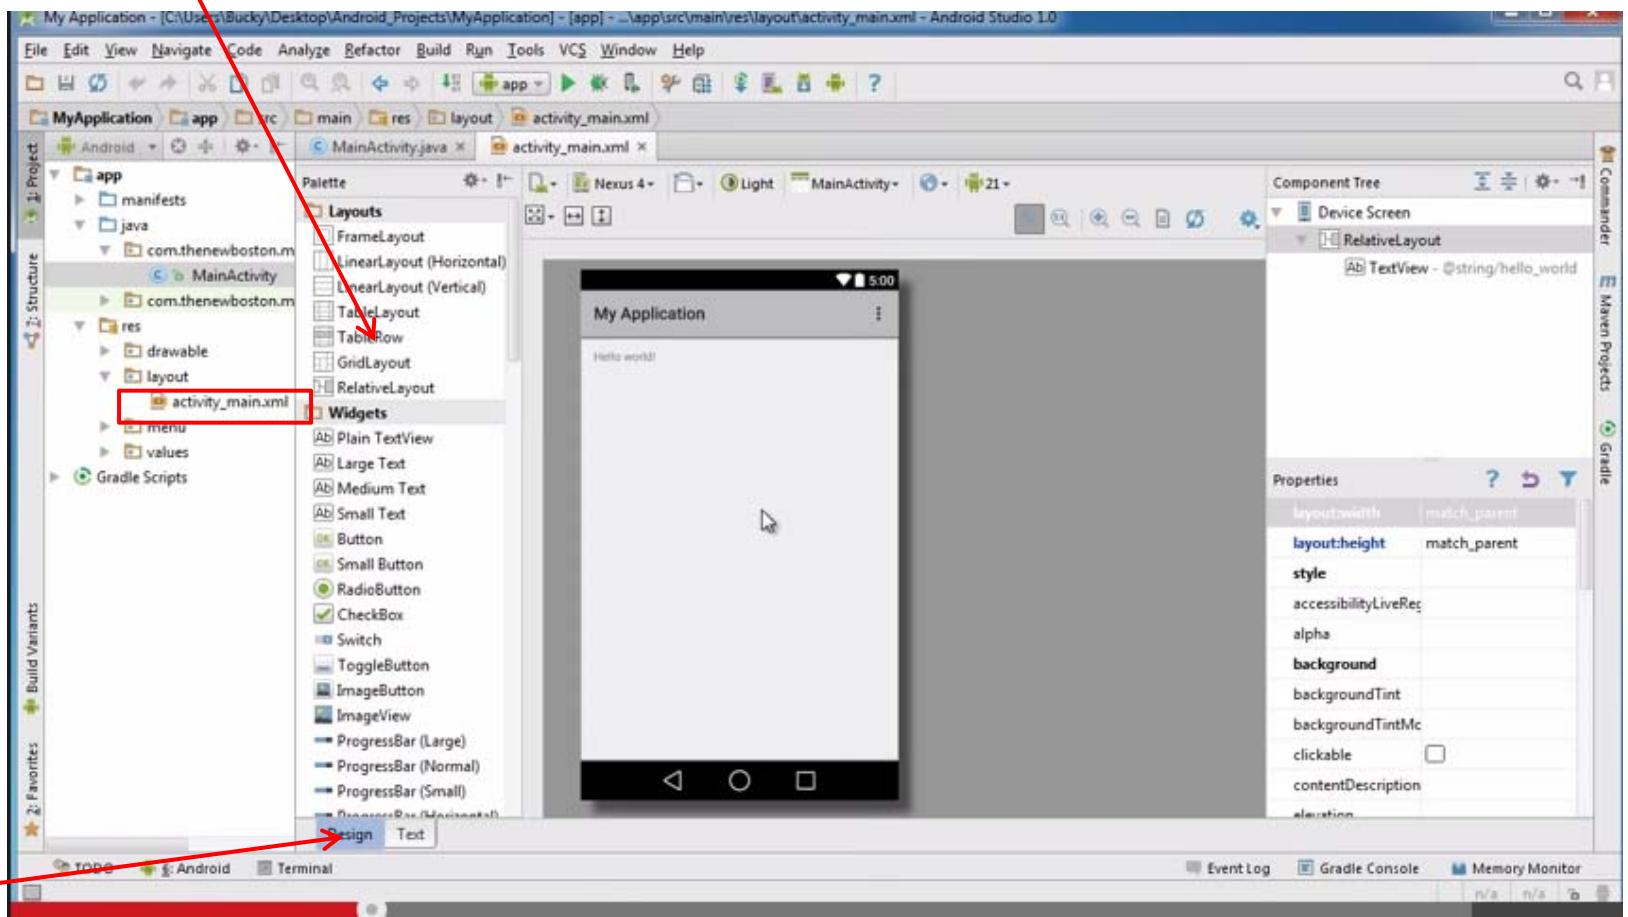

App running on
Emulator (can edit
Text, drag and drop)

Activity_main.xml

- **Widgets:** elements that can be dragged onto activity (screen)
- **Design View:** Design app screen using Drag-and-drop widgets

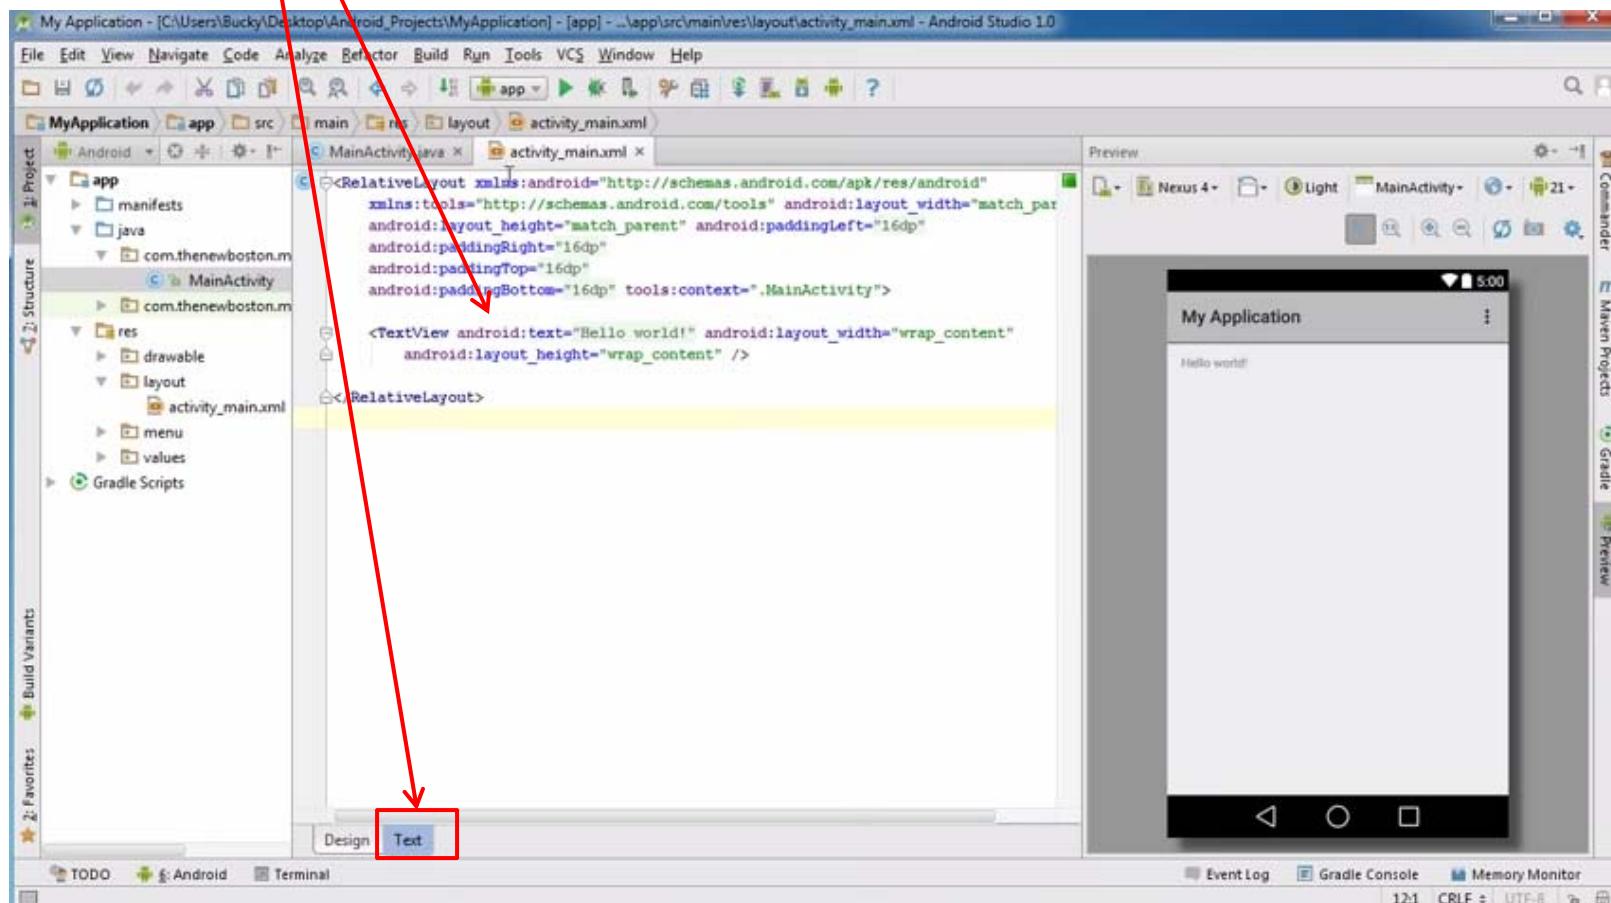

Design
view

Activity_main.xml: Text View

- **Text view:** Design screen by editting XML file directly
- **Note:** dragging and dropping widgets auto-generates corresponding XML

MainActivity.java

- Java code, defines actions, handles interaction/put taken (intelligence)
 - E.g. What app will do when button/screen clicked

```
My Application - [C:\Users\Bucky\Desktop\Android_Projects\MyApplication] - [app] - ...app\src\main\java\com\thenewboston\myapplication\MainActivity.java - Android Studio 1.0
File Edit View Navigate Code Analyze Refactor Build Run Tools VCS Window Help
MyApplication app src main java com thenewboston myapplication c MainActivity
MainActivity.java activity_main.xml
package com.thenewboston.myapplication;

import android.support.v7.app.ActionBarActivity;
import android.os.Bundle;
import android.view.Menu;
import android.view.MenuItem;

public class MainActivity extends ActionBarActivity {

    @Override
    protected void onCreate(Bundle savedInstanceState) {
        super.onCreate(savedInstanceState);
        setContentView(R.layout.activity_main);
    }

    @Override
    public boolean onCreateOptionsMenu(Menu menu) {
        // Inflate the menu; this adds items to the action bar if it is present.
        getMenuInflater().inflate(R.menu.menu_main, menu);
        return true;
    }

    @Override
    public boolean onOptionsItemSelected(MenuItem item) {
        // Handle action bar item clicks here. The action bar will
        // automatically handle clicks on the Home/Up button, so long
        // as you specify a parent activity in AndroidManifest.xml
        int id = item.getItemId();

        //noinspection SimplifiableIfStatement
    }
}
```

AndroidManifest.xml

- App's starting point (a bit like main() in C)

```
<?xml version="1.0" encoding="utf-8"?>
<manifest xmlns:android="http://schemas.android.com/apk/res/android"
    package="com.thenevboston.myapplication" >

    <application
        android:allowBackup="true"
        android:icon="@drawable/ic_launcher"
        android:label="My Application"
        android:theme="@style/AppTheme" >
        <activity
            android:name=".MainActivity"
            android:label="My Application" >
            <intent-filter>
                <action android:name="android.intent.action.MAIN" />
                <category android:name="android.intent.category.LAUNCHER" />
            </intent-filter>
        </activity>
    </application>
</manifest>
```

Resources

Declaring Strings in Strings.xml

- Can declare all strings in strings.xml

String declaration in strings.xml

```
<?xml version="1.0" encoding="utf-8"?>
<resources>

    <string name="app_name">EmPubLite</string>
    <string name="hello_world">Hello world!</string>

</resources>
```

- Then reference in any of your app's xml files

```
        android:layout_width="match_parent"
        android:layout_height="match_parent"
        tools:context=".EmPubLiteActivity">

    <TextView
        android:layout_width="wrap_content"
        android:layout_height="wrap_content"
        android:layout_centerHorizontal="true"
        android:layout_centerVertical="true"
        android:text="@string/hello_world"/>

</RelativeLayout>
```

Strings in AndroidManifest.xml

- Strings declared in strings.xml can be referenced by all other XML files (activity_my.xml, AndroidManifest.xml)

String declaration in strings.xml

```
<?xml version="1.0" encoding="utf-8"?>
<resources>

    <string name="app_name">EmPubLite</string>
    <string name="hello_world">Hello world!</string>

</resources>
```

String usage in AndroidManifest.xml

```
<application
    android:allowBackup="false"
    android:icon="@drawable/ic_launcher"
    android:label="@string/app_name"
    android:theme="@style/AppTheme">
    <activity
        android:name="EmPubLiteActivity"
        android:label="@string/app_name">
        <intent-filter>
            <action android:name="android.intent.action.MAIN"/>

            <category android:name="android.intent.category.LAUNCHER"/>
        </intent-filter>
    </activity>
</application>

</manifest>
```

Where is strings.xml in Android Studio?

Editting any string in strings.xml changes it wherever it is displayed

The screenshot shows the Android Studio interface with the following details:

- Project Bar:** Shows "MyFirstAndroidApp" as the active project.
- Toolbars:** Standard Android Studio toolbars for File, Edit, View, Navigate, Code, Analyze, Refactor, Build, Run, Tools, VCS, Window, Help.
- Toolbar Buttons:** Includes icons for Project, Recent Projects, Open, Save, Undo, Redo, Run, Stop, Build, Clean, Sync, and Help.
- Project Structure:** On the left, the project tree shows "MyFirstAndroidAppProject" with subfolders ".idea", "gradle", and "MyFirstAndroidApp". "MyFirstAndroidApp" contains "build", "libs", "src" (with "main" and "values" folders), "AndroidManifest.xml", and "ic_launcher-web.png". "values" folder contains "dimens.xml", "strings.xml" (highlighted with a red box), and "styles.xml". "main" folder contains "layout" (with "activity_main.xml") and "menu".
- Editor:** The main editor area displays the "strings.xml" file under "res/values". The file content is:

```
<?xml version="1.0" encoding="utf-8"?>
<resources>
    <string name="app_name">My First Android App</string>
    <string name="action_settings">Settings</string>
    <string name="hello_world">Hello world!</string>
</resources>
```

A red arrow points from the text "Hello world!" in the XML to the text "Hello world!" in the red box below it.
- Bottom Status Bar:** Shows "Compilation completed successfully in 6 sec (16 minutes ago)" and "Event Log".
- Bottom Navigation:** Includes "TODO", "Android", "Event Log", "1:1", "CRLF", "UTF-8", "Insert", and file size "235M of 711M".

Styled Text

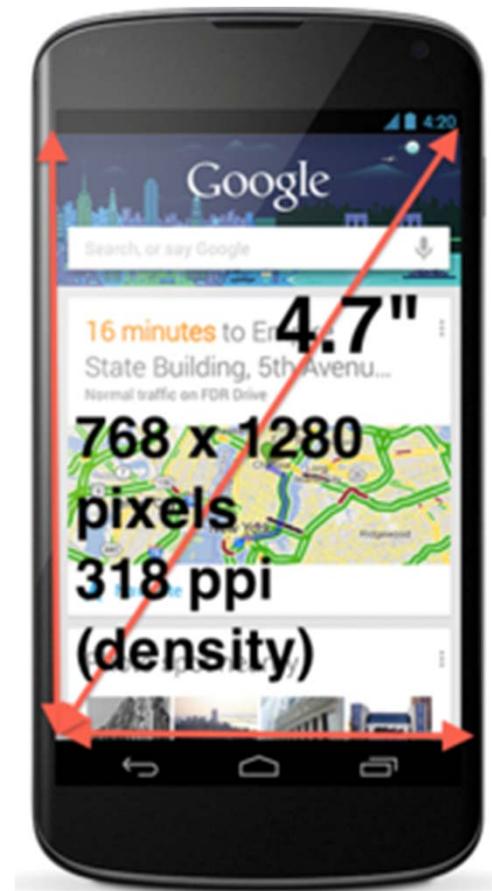

- In HTML, tags can be used for italics, bold, etc
 - E.g. <i> Hello </i> makes text *Hello*
 - Hello makes text **Hello**
- Can use the same HTML tags to add style (italics, bold, etc) to Android strings

```
<resources>
    <string name="b">This has <b>bold</b> in it.</string>
    <string name="i">Whereas this has <i>italics</i>!</string>
</resources>
```

Phone Dimensions Used in Android UI

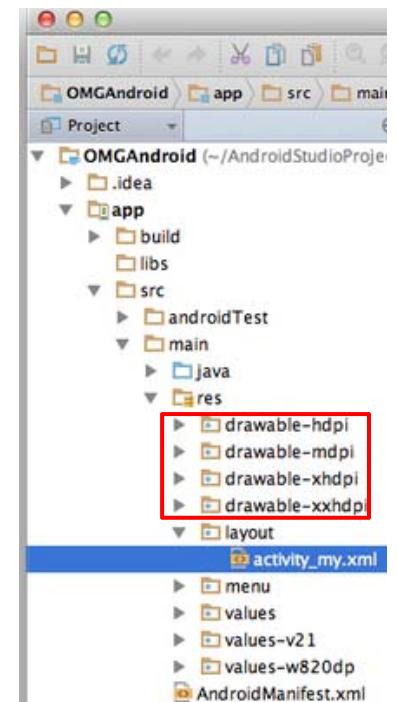

- Physical dimensions measured diagonally
 - E.g. Nexus 4 is 4.7 inches diagonally
- Resolution in pixels
 - E.g. Nexus 4 resolution 768 x 1280 pixels
- Pixels per inch (PPI) =
 - $\text{Sqrt}[(768 \times 768) + (1280 \times 1280)] / 4.7 = 318$
- Dots per inch (DPI) is number of pixels in a physical area
 - Low density (ldpi) = 120 dpi
 - Medium density (mdpi) = 160 dpi
 - High density (hdpi) = 240 dpi
 - Extra High Density (xhdpi) = 320 dpi

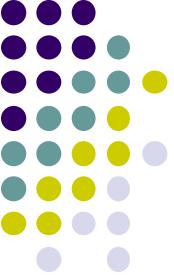

Adding Pictures

- Android supports images in PNG, JPEG and GIF formats
- Default directory for images (drawables) is **res/drawable-xyz**
- Images in **res/drawable-xyz** can be referenced by XML and java files
 - **res/drawable-ldpi**: low dpi images (~ 120 dpi of dots per inch)
 - **res/drawable-mdpi**: medium dpi images (~ 160 dpi)
 - **res/drawable-hdpi**: high dpi images (~ 240 dpi)
 - **res/drawable-xhdpi**: extra high dpi images (~ 320 dpi)
 - **res/drawable-xxhdpi**: extra extra high dpi images (~ 480 dpi)
 - **res/drawable-xxxhdpi**: high dpi images (~ 640 dpi)
- Images in these directories are **different resolutions, same size**

Adding Pictures

- Just the generic picture name is used (no format e.g. png)
 - No specification of what resolution to use
 - E.g. to reference an image **ic_launcher.png**

```
<application
    android:allowBackup="false"
    android:icon="@drawable/ic_launcher"
    android:label="@string/app_name"
    android:theme="@style/AppTheme">
    </application>
```

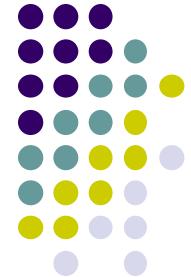

- Android chooses which directory (e.g. -mdpi) at run-time based on actual device resolution
- Android studio tools for generating icons
 - **Icon wizard or Android asset studio:** generates icons in various densities from starter image
 - Cannot edit images (e.g. dimensions) with these tools

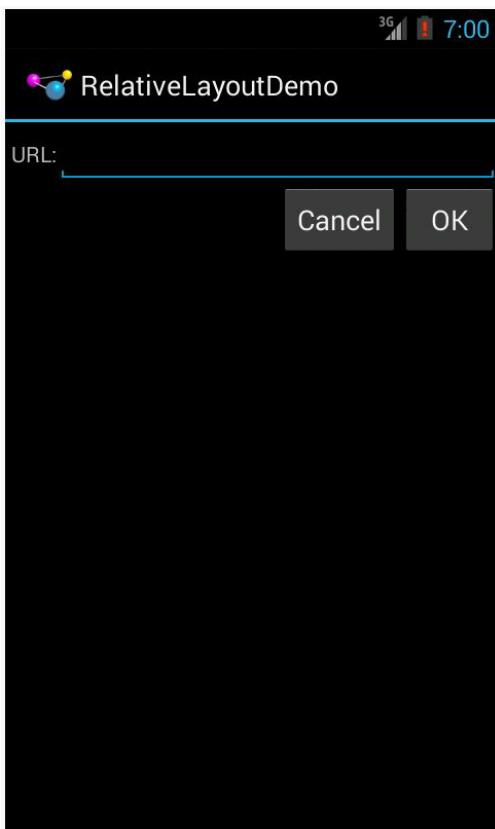

Styles

- Styles specify rules for look of Android screen
- Similar to Cascaded Style Sheets (CSS) in HTML
- E.g CSS enables setting look of certain types of tags.
 - E.g. font and size of all `<h1>` and `<h2>` elements
- Android widgets have properties
 - E.g. Foreground color = red
- **Styles in Android:** collection of values for properties
- Styles can be specified one by one or themes (e.g. Theme, Theme.holo and Theme.material) can be used

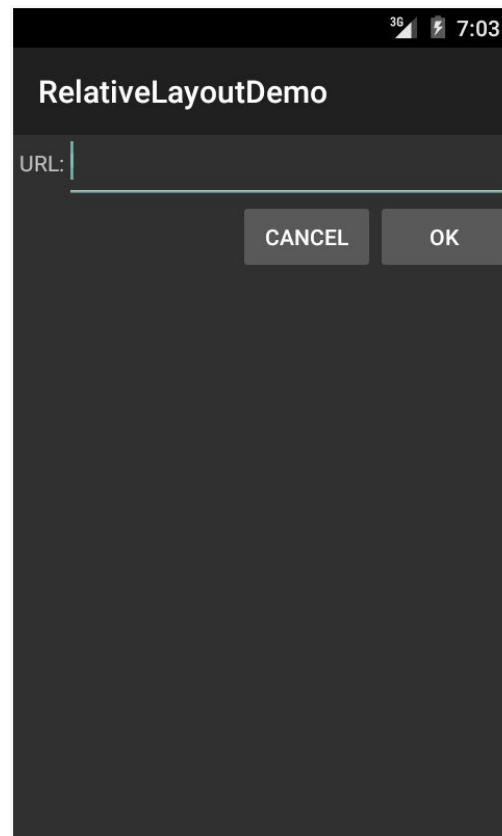

Default Themes

- Android chooses a default theme if you specify none
- Many stock themes to choose from

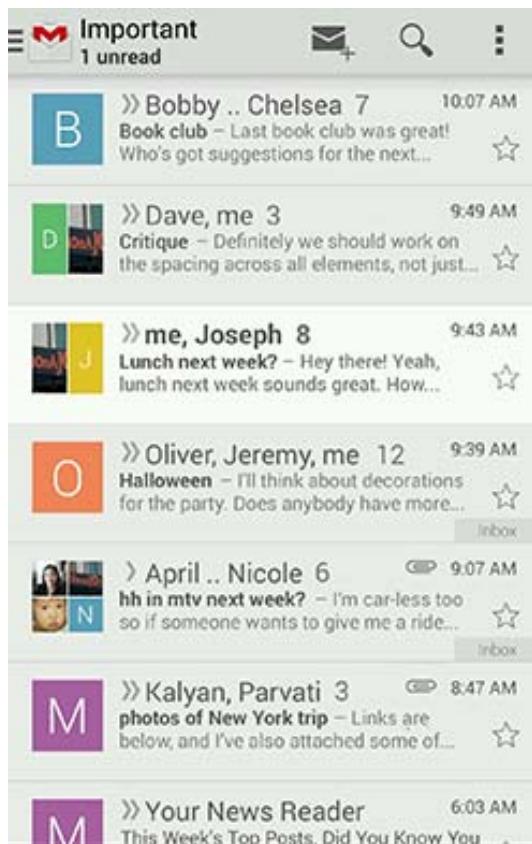

Theme.Holo: default theme
in Android 3.0

Theme.Material: default theme
in Android 5.0

Examples of Themes in Use

GMAIL in Holo Light

Settings screen in Holo Dark
