Computer Graphics (CS 4731)
Lecture 22: 2D Clipping

Prof Emmanuel Agu

Computer Science Dept.

*Worcester Polytechnic Institute (WPI)*

OpenGL Stages

- After projection, several stages before objects drawn to screen
- These stages are **NOT** programmable

Vertex shader: programmable

In hardware: **NOT** programmable

Hardware Stage: Primitive Assembly

- Up till now: Transformations and projections applied to vertices individually

- **Primitive assembly:** After transforms, projections, individual vertices grouped back into primitives

- **E.g. v6, v7 and v8** grouped back into triangle

Hardware Stage: Clipping

- After primitive assembly, subsequent operations are per-primitive

- **Clipping:** Remove primitives (lines, polygons, text, curves) outside view frustum (canonical view volume)
Clipping lines

Clipping polygons

Rasterization

- Determine which pixels that primitives map to
  - Fragment generation
 - Rasterization or scan conversion

Fragment Processing

- Some tasks deferred until fragment processing

Hidden Surface Removal

Antialiasing

Modeling → Geometric processing → Rasterization → Fragment processing → Frame buffer

Transformation Projection

**Hidden surface Removal Antialiasing**
Clipping

- 2D and 3D clipping algorithms
    - 2D against clipping window
    - 3D against clipping volume
- 2D clipping
    - Lines (e.g. dino.dat)
    - Polygons
    - Curves
    - Text

ABC

AB

Clipping 2D Line Segments

- **Brute force approach:** compute intersections with all sides of clipping window
  - Inefficient: one division per intersection
2D Clipping

- **Better Idea:** eliminate as many cases as possible without computing intersections
- Cohen-Sutherland Clipping algorithm

$$y = y_{max}$$

$$x = x_{min} \qquad x = x_{max}$$

$$y = y_{min}$$

Clipping Points

(xmax, ymax)
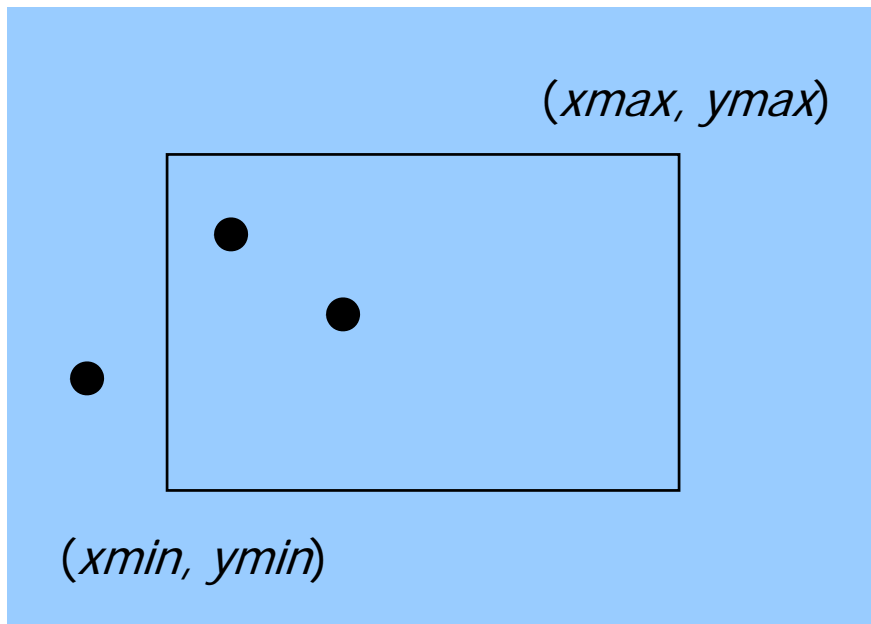

(xmin, ymin)

Determine whether a point (x,y) is inside or outside of the world window?

If   (xmin <= x <= xmax)
and (ymin <= y <= ymax)

then the point (x,y) is inside
else the point is outside

Clipping Lines
3 cases:

Case 1: All of line in
Case 2: All of line out
Case 3: Part in, part out

Clipping Lines: Trivial Accept

(Xmax, Ymax)

p1

p2

(Xmin, Ymin)
Case 1: All of line in
Test line endpoints:

> *Xmin <= P1.x, P2.x <= Xmax   and*
> *Ymin <= P1.y, P2.y <= Ymax*

Note: simply comparing x,y values of
endpoints to x,y values of rectangle

Result: trivially accept.
Draw line in completely

Clipping Lines: Trivial Reject

p1

p2
Case 2: All of line out
Test line endpoints:

- *p1.x, p2.x <= Xmin   OR*
- *p1.x, p2.x >= Xmax   OR*
- *p1.y, p2.y <= ymin   OR*
- *p1.y, p2.y >= ymax*

Note: simply comparing x,y values of endpoints to x,y values of rectangle

Result: trivially reject.
Don't draw line in

Clipping Lines: Non-Trivial Cases
Case 3: Part in, part out

Two variations:
    One point in, other out
    Both points out, but part of line cuts
       through viewport

Need to find inside segments

Use similar triangles to figure out length
    of inside segments

$$\frac{d}{dely} = \frac{e}{delx}$$

Clipping Lines: Calculation example
If chopping window has
(left, right, bottom, top) = (30, 220, 50, 240),
what happens when the following lines are
chopped?

(a) p1 = (40,140), p2 = (100, 200)

(b) p1 = (20,10), p2 = (20, 200)

$$\frac{d}{dely} = \frac{e}{delx}$$

(c) p1 = (100,180), p2 = (200, 250)

Cohen-Sutherland pseudocode (Hill)

```
int clipSegment(Point2& p1, Point2& p2, RealRect W)
{
   do{
       if(trivial accept) return 1; // whole line survives
       if(trivial reject) return 0;  // no portion survives
       // now chop
       if(p1 is outside)
       //  find surviving segment
       {
           if(p1 is to the left) chop against left edge
           else if(p1 is to the right) chop against right edge
           else if(p1 is below) chop against the bottom edge
           else if(p1 is above) chop against the top edge
       }
```

Cohen-Sutherland pseudocode (Hill)

```
        else // p2 is outside
              // find surviving segment
        {
           if(p2 is to the left) chop against left edge
         else if(p2 is to right) chop against right edge
         else if(p2 is below) chop against the bottom edge
         else if(p2 is above) chop against the top edge
        }
   }while(1);
}
```

Computer Graphics (CS 4731)
# Lecture 22: 3D Clipping

Prof Emmanuel Agu

Computer Science Dept.

Worcester Polytechnic Institute (WPI)
Liang-Barsky 3D Clipping

- **Goal:** Clip object edge-by-edge against Canonical View volume (CVV)

- **Problem:**

  - 2 end-points of edge: **A = (Ax, Ay, Az, Aw)** and **C = (Cx, Cy, Cz, Cw)**
  - If edge intersects with CVV, compute intersection point **I =(Ix,Iy,Iz,Iw)**

Determining if point is inside CVV

$y = 1$

$y = -1$

$x = -1$

$x = 1$
■ **Problem:** Determine if point (x,y,z) is inside or outside CVV?

Point (x,y,z) is **inside CVV if**

$$(-1 <= x <= 1)$$
and $(-1 <= y <= 1)$
and $(-1 <= z <= 1)$

else point **is outside CVV**

■**CVV == 6 infinite planes (x=-1,1;   y=-1,1;   z=-1,1)**

Determining if point is inside CVV

$y/w = 1$

$y/w = -1$

$x/w = -1$

$x /w = 1$
- If point specified as (x,y,z,w)
- **Test (x/w, y/w, z/w)!**

Point (x/w, y/w, z/w) is inside CVV

    if (-1 <= **x/w** <= 1)
and (-1 <= **y/w** <= 1)
and (-1 <= **z/w** <= 1)

else point is outside CVV

Modify Inside/Outside Tests Slightly
Our test: $(-1 < $ **x/w** $ < 1)$

Point (x,y,z,w) inside plane x = 1 if

$$x/w < 1$$
$$=> \quad \mathbf{w - x > 0}$$

Point (x,y,z,w) inside plane x = -1 if

$$-1 < x/w$$
$$=> \quad \mathbf{w + x > 0}$$

Numerical Example: Inside/Outside CVV Test

- Point (x,y,z,w) is
    - inside plane x=-1 **if w+x > 0**
    - inside plane x=1 **if w – x > 0**

$$-1 \qquad\qquad\qquad 1$$

$$\xrightarrow{\hspace{5cm}} x/w$$

- Example Point (0.5, 0.2, 0.7) inside planes (x = -1,1) because - 1 <= 0.5 <= 1

- If w = 10,   (0.5, 0.2, 0.7) = (5, 2, 7, 10)
- Can either **divide by w** then test: – 1 <= 5/10 <= 1 **OR**

  To test if inside   x = - 1,   **w + x =**   10 + 5 = 15 > 0
  To test if inside   x = 1,   **w - x =**   10 - 5 = 5   > 0

3D Clipping

- Do same for y, z to form boundary coordinates for 6 planes as:

Boundary coordinate (BC)	Homogenous coordinate	Clip plane	Example (5,2,7,10)
BC0	w+x	x=-1	15
BC1	w-x	x=1	5
BC2	w+y	y=-1	12
BC3	w-y	y=1	8
BC4	w+z	z=-1	17
BC5	w-z	z=1	3

- **Consider line that goes from point A to C**
  - **Trivial accept:** 12 BCs (6 for pt. A, 6 for pt. C) > 0
  - **Trivial reject:** Both endpoints outside (-ve) for same plane
