

# Computer Graphics (CS 543)

## Lecture 7b: Derivation of Perspective Projection Transformation

Prof Emmanuel Agu

*Computer Science Dept.  
Worcester Polytechnic Institute (WPI)*

# Perspective Projection

- Projection – map the object from 3D space to 2D screen

**Perspective()**  
**Frustum( )**

# Perspective Projection: Classical

Based on similar triangles:

$$\frac{y'}{y} = \frac{N}{-z}$$

➔  $y' = y \times \frac{N}{-z}$

# Perspective Projection: Classical

- So  $(x^*, y^*)$  projection of point,  $(x, y, z)$  unto near plane N is given as:

$$(x^*, y^*) = \left( x \frac{N}{-z}, y \frac{N}{-z} \right)$$

- Numerical example:

Q. Where on the viewplane does  $P = (1, 0.5, -1.5)$  lie for a near plane at  $N = 1$ ?

$$(x^*, y^*) = \left( x \frac{N}{-z}, y \frac{N}{-z} \right) = \left( 1 \times \frac{1}{1.5}, 0.5 \times \frac{1}{1.5} \right) = (0.666, 0.333)$$

# Pseudodepth

- Classical perspective projection projects  $(x,y)$  coordinates to  $(x^*, y^*)$ , drops  $z$  coordinates

- But we need  $z$  to find closest object (depth testing)!!!

# Perspective Transformation

- **Perspective transformation** maps actual z distance of perspective view volume to range  $[-1 \text{ to } 1]$  (**Pseudodepth**) for canonical view volume

We want **perspective Transformation** and **NOT classical projection!!**

Set scaling z  
 $\text{Pseudodepth} = az + b$   
Next solve for a and b

# Perspective Transformation

- We want to transform viewing frustum volume into canonical view volume

# Perspective Transformation using Pseudodepth

$$(x^*, y^*, z^*) = \left( x \frac{N}{-z}, y \frac{N}{-z}, \frac{az + b}{-z} \right)$$

- Choose  $a, b$  so as  $z$  varies from **Near** to **Far**, pseudodepth varies from **-1** to **1** (canonical cube)

- Boundary conditions
  - $z^* = -1$  when  $z = -N$
  - $z^* = 1$  when  $z = -F$

# Transformation of $z$ : Solve for $a$ and $b$

- Solving:

$$z^* = \frac{az + b}{-z}$$

- Use boundary conditions

- $z^* = -1$  when  $z = -N$ .....(1)

- $z^* = 1$  when  $z = -F$ .....(2)

- Set up simultaneous equations

$$-1 = \frac{-aN + b}{N} \Rightarrow -N = -aN + b \dots \dots (1)$$

$$1 = \frac{-aF + b}{F} \Rightarrow F = -aF + b \dots \dots (2)$$

# Transformation of $z$ : Solve for $a$ and $b$

$$-N = -aN + b \dots \dots (1)$$

$$F = -aF + b \dots \dots (2)$$

- Multiply both sides of (1) by -1

$$N = aN - b \dots \dots (3)$$

- Add eqns (2) and (3)

$$F + N = aN - aF$$

$$\Rightarrow a = \frac{F + N}{N - F} = \frac{-(F + N)}{F - N} \dots \dots (4)$$

- Now put (4) back into (3)

# Transformation of $z$ : Solve for $a$ and $b$

- Put solution for  $a$  back into eqn (3)

$$N = aN - b \dots \dots (3)$$

$$\Rightarrow N = \frac{-N(F + N)}{F - N} - b$$

$$\Rightarrow b = -N - \frac{-N(F + N)}{F - N}$$

$$\Rightarrow b = \frac{-N(F - N) - N(F + N)}{F - N} = \frac{-NF - N^2 - NF + N^2}{F - N} = \frac{-2NF}{F - N}$$

- So

$$a = \frac{-(F + N)}{F - N} \qquad b = \frac{-2FN}{F - N}$$

# What does this mean?

- Original point  $z$  in original view volume, transformed into  $z^*$  in canonical view volume

$$z^* = \frac{az + b}{-z}$$

- where

$$a = \frac{-(F + N)}{F - N}$$

$$b = \frac{-2FN}{F - N}$$

# Homogenous Coordinates

- Want to express projection transform as 4x4 matrix
- Previously, homogeneous coordinates of  
 $P = (P_x, P_y, P_z) \Rightarrow (P_x, P_y, P_z, 1)$
- Introduce arbitrary scaling factor,  $w$ , so that  
 $P = (wP_x, wP_y, wP_z, w)$  (**Note:**  $w$  is non-zero)
- For example, the point  $P = (2, 4, 6)$  can be expressed as
  - $(2, 4, 6, 1)$
  - or  $(4, 8, 12, 2)$  where  $w=2$
  - or  $(6, 12, 18, 3)$  where  $w = 3$ , or....
- To convert from homogeneous back to ordinary coordinates, first divide all four terms by  $w$  and discard 4<sup>th</sup> term

# Perspective Projection Matrix

- Recall Perspective Transform

$$(x^*, y^*, z^*) = \left( x \frac{N}{-z}, y \frac{N}{-z}, \frac{az + b}{-z} \right)$$

- We have:  $x^* = x \frac{N}{-z}$        $y^* = y \frac{N}{-z}$        $z^* = \frac{az + b}{-z}$

- In matrix form:

$$\begin{pmatrix} N & 0 & 0 & 0 \\ 0 & N & 0 & 0 \\ 0 & 0 & a & b \\ 0 & 0 & -1 & 0 \end{pmatrix} \begin{pmatrix} wx \\ wy \\ wz \\ w \end{pmatrix} = \begin{pmatrix} wNx \\ wNy \\ w(az + b) \\ -wz \end{pmatrix} \Rightarrow \begin{pmatrix} x \frac{N}{-z} \\ y \frac{N}{-z} \\ \frac{az + b}{-z} \\ 1 \end{pmatrix}$$

**Perspective Transform Matrix**      **Original vertex**      **Transformed Vertex**      **Transformed Vertex after dividing by 4<sup>th</sup> term**

# Perspective Projection Matrix

$$\begin{pmatrix} N & 0 & 0 & 0 \\ 0 & N & 0 & 0 \\ 0 & 0 & a & b \\ 0 & 0 & -1 & 0 \end{pmatrix} \begin{pmatrix} wP_x \\ wP_y \\ wP_z \\ w \end{pmatrix} = \begin{pmatrix} wNP_x \\ wNP_y \\ w(aP_z + b) \\ -wP_z \end{pmatrix} \Rightarrow \begin{pmatrix} x \frac{N}{-z} \\ y \frac{N}{-z} \\ \frac{az + b}{-z} \\ 1 \end{pmatrix}$$

$$a = \frac{-(F+N)}{F-N} \quad b = \frac{-2FN}{F-N}$$

- In perspective transform matrix, already solved for  $a$  and  $b$ :
- So, we have transform matrix to transform  $\mathbf{z}$  values

# Perspective Projection

- Not done yet!! Can now transform z!
- Also need to transform the  $\mathbf{x} = (\text{left}, \text{right})$  and  $\mathbf{y} = (\text{bottom}, \text{top})$  ranges of viewing frustum to  $[-1, 1]$
- Similar to glOrtho, we need to translate and scale previous matrix along x and y to get final projection transform matrix
- we translate by
  - $-(\text{right} + \text{left})/2$  in x
  - $-(\text{top} + \text{bottom})/2$  in y
- Scale by:
  - $2/(\text{right} - \text{left})$  in x
  - $2/(\text{top} - \text{bottom})$  in y

# Perspective Projection

- Translate along x and y to line up center with origin of CVV
  - $-(right + left)/2$  in x
  - $-(top + bottom)/2$  in y
- Multiply by translation matrix:

$$\begin{pmatrix} 1 & 0 & 0 & -(right + left) / 2 \\ 0 & 1 & 0 & -(top + bottom) / 2 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

**Line up centers  
Along x and y**

# Perspective Projection

- To bring view volume size down to size of of CVV, scale by
  - $2/(\text{right} - \text{left})$  in x
  - $2/(\text{top} - \text{bottom})$  in y
- Multiply by scale matrix:

$$\begin{pmatrix} \frac{2}{\text{right} - \text{left}} & 0 & 0 & 0 \\ 0 & \frac{2}{\text{top} - \text{bottom}} & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

**Scale size down  
along x and y**

# Perspective Projection Matrix

Previous  
Perspective  
Transform  
Matrix

$$\begin{pmatrix} \frac{2}{right - left} & 0 & 0 & 0 \\ 0 & \frac{2}{top - bottom} & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} \times \begin{pmatrix} 1 & 0 & 0 & -(right + left) / 2 \\ 0 & 1 & 0 & -(top + bottom) / 2 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} \times \begin{pmatrix} N & 0 & 0 & 0 \\ 0 & N & 0 & 0 \\ 0 & 0 & a & b \\ 0 & 0 & -1 & 0 \end{pmatrix}$$

→

$$\begin{pmatrix} \frac{2N}{x \max - x \min} & 0 & \frac{right + left}{right - left} & 0 \\ 0 & \frac{2N}{top - bottom} & \frac{top + bottom}{top - bottom} & 0 \\ 0 & 0 & \frac{-(F + N)}{F - N} & \frac{-2FN}{F - N} \\ 0 & 0 & -1 & 0 \end{pmatrix}$$

**Final Perspective  
Transform Matrix**

**glFrustum(left, right, bottom, top, N, F)**    N = near plane, F = far plane

# Perspective Transformation

- After perspective transformation, viewing frustum volume is transformed into canonical view volume

# Geometric Nature of Perspective Transform

- a) Lines through eye map into lines parallel to  $z$  axis after transform
- b) Lines perpendicular to  $z$  axis map to lines perp to  $z$  axis after transform

# Normalization Transformation
