## CS3133

## Homework \#4

## I worked with:

## I consulted:

\#1. a) Given the following PDA, M:

$$
\begin{aligned}
& \mathrm{Q}=\left\{\mathrm{q}_{0}, \mathrm{q}_{1}, \mathrm{q}_{2}\right\} \\
& \Sigma=\{\mathrm{a}, \mathrm{~b}\} \\
& \Gamma=\{\mathrm{A}\} \\
& \mathrm{F}=\left\{\mathrm{q}_{1}, \mathrm{q}_{2}\right\}
\end{aligned}
$$

$$
\delta\left(\mathrm{q}_{0}, \mathrm{a}, \lambda\right)=\left\{\left[\mathrm{q}_{0}, \mathrm{~A}\right]\right\}
$$

$$
\delta\left(q_{0}, \lambda, \lambda\right)=\left\{\left[q_{1}, \lambda\right]\right\}
$$

$$
\delta\left(\mathrm{q}_{0}, \mathrm{~b}, \mathrm{~A}\right)=\left\{\left[\mathrm{q}_{2}, \lambda\right]\right\}
$$

$$
\delta\left(\mathrm{q}_{1}, \lambda, \mathrm{~A}\right)=\left\{\left[\mathrm{q}_{1}, \lambda\right]\right\}
$$

$$
\delta\left(\mathrm{q}_{2}, \mathrm{~b}, \mathrm{~A}\right)=\left\{\left[\mathrm{q}_{2}, \lambda\right]\right\}
$$

$$
\delta\left(\mathrm{q}_{2}, \lambda, \mathrm{~A}\right)=\left\{\left[\mathrm{q}_{2}, \lambda\right]\right\}
$$

a) Draw the graph for M

b) Trace the computations of $a a b, a b b, a b a, a a b b$

$$
\begin{aligned}
& {[q 0, a a b, \lambda] \rightarrow[q 0, a b, A] \rightarrow[q 0, b, A] \rightarrow[q 2, \lambda, \lambda] \text { (accepted) }} \\
& {[q 0, a b b, \lambda] \rightarrow[q 0, b b, A] \rightarrow[q 0, b, \lambda] \rightarrow[q 1, b, \lambda] \text { (rejected) }} \\
& {[q 0, a b a, \lambda] \rightarrow[q 0, b a, A] \rightarrow[q 0, a, \lambda] \rightarrow[q 1, a, \lambda] \text { (rejected) }} \\
& {[q 0, a a b b, \lambda] \rightarrow[q 0, a b b, A] \rightarrow[q 0, b b, A A] \rightarrow[q 2, b, A] \rightarrow[q 2, \lambda, \lambda] \text { (accepted) }}
\end{aligned}
$$

b) What is $L(M)$ ?
$\mathbf{L}(\mathbf{M})=\left\{a^{n} b^{m} \mid n \geq m \geq 0\right\}$
\#2. a) Construct a PDA to accept $\left\{a^{2 i} b^{i} \mid i \geq 0\right\}$

b) Show computations on $a a b$ and $a b b$
$[q 0, a a b, \lambda] \rightarrow[q 1, a b, A] \rightarrow[q 0, b, B] \rightarrow[q 0, \lambda, \lambda]$ (accepts)
$[q 0, a b b, \lambda] \rightarrow \rightarrow[q 1, b b, A] \rightarrow$ halts (rejects)
\#3. Show context free languages are closed under reversal.
If $L$ is a CFL, there is a grammar, $G$, with $L=L(G)$.
For any production, $\mathbf{A} \rightarrow \alpha$ in $\mathbf{G}$, create a new grammar with $A \rightarrow \alpha^{R}$

For $L=\left\{a^{n} b^{n} \mid n \geq 0\right\}, G$ is
$\mathrm{S} \rightarrow \mathbf{a} \mathbf{S} \mathbf{b} \mid \lambda$
and $G$ for $L^{R}=\left\{b^{n} a^{n} \mid n \geq 0\right\}$, is
$\mathbf{S} \rightarrow \mathbf{b S a |} \boldsymbol{\lambda}$
\#4. \#4. Use the pumping lemma to show that $\mathrm{L}=\left\{\mathrm{w} \mathrm{w}^{\mathrm{R}} \mathrm{w} \mid \mathrm{w} \varepsilon\{\mathrm{a}, \mathrm{b}\}^{*}\right\}$ is not contextfree.

If $L$ were regular, then there is a constant, $k$, such that if $z \varepsilon L$ and $|z| \geq k$, the PL conditions are true.
Pick $z=a^{n} b^{n} b^{n} a^{n} a^{n} b^{n}$. Then $z \varepsilon L$ and $|z| \geq k$
So
$\mathrm{z}=u v w x y$ with
$|v w x| \leq k$
$|v|+|y|>0$ (i.e., not both $v$ and $x$ are $\lambda$ )
There are two cases:
Case $1 v w x$ is completely within one of the $a^{n}$ or $b^{n \prime}$, say the first $b^{n}$

Assume $|\mathbf{v}|>0$ so $\mathbf{v}=b^{p}$ with $p>0$. (Results will be similar if $|\mathbf{x}|>0$ )
Then $u v v w_{x} y=a^{n} b^{n+p} b^{n} a^{n} a^{n} b^{n}$ and there is no way to split this up to be of the form: $\mathbf{w} \mathbf{w}^{\mathrm{R}} \mathbf{w}$

Case 2 z overlaps a's and b's or b's and a's: then either first and last w will not be the same or again no way to split this up to be of the form: $w w^{R} w$
\#5. Given a transition function $\delta(q, a)$, defined on a symbol $a$ :
a) (1 point) Define the extended transition function $\delta^{*}(\mathbf{q}, \mathbf{w})$, defined on strings $w$ (you may use either the text's definition or the one used in class)

See class notes and/or text
b) (7 points) Prove using induction that $\delta^{*}\left(\mathbf{q}, \mathbf{w}_{1} \mathbf{w}_{2}\right)=\delta^{*}\left(\delta^{*}\left(\mathbf{q}, \mathbf{w}_{1}\right), \mathbf{w}_{2}\right)$. State clearly what you are doing the induction on, set the proof up clearly and give reasons for each step.

Done in class (Monday, Sept. 11)
c) (2 points) Use part $\mathbf{b}$ and the fact that $\delta^{*}(\mathbf{q}, \mathbf{a})=\delta(\mathbf{q}, \mathbf{a})$ to show $\delta^{*}(\mathbf{q}, \mathbf{a w})=$ $\delta^{*}(\delta(\mathbf{q}, \mathbf{a}), \mathbf{w})$
$\delta^{*}(\mathbf{q}, \mathbf{a w})=\delta^{*}(\delta *(\mathbf{q}, \mathbf{a}), \mathbf{w}) \quad$ by part $\mathbf{b}$
$=\delta^{*}(\delta(\mathbf{q}, \mathbf{a}), \mathbf{w}) \quad$ given that $\delta^{*}(\mathbf{q}, \mathbf{a})=\delta(\mathbf{q}, \mathbf{a})$
